MEDDLING WITH MICROTAX

Using this package with the Dragon 32 perhaps you too could be equal to the mysterious methods of the Inland Revenue? Tony Harrington investigates.

A UCSD-p data management system which claims to be the most portable of all. Kathy Lang examines this assertion.

APPLE LISA

PCW flew Robin Webster to California to put the first full commercial Lisa system through its paces, and to talk to its design engineers.

ECALC FOR EPSON

164 Is the portable HX-20 a suitable vehicle for spreadsheets? Mike Liardet gives it a fair trial.

EPSON OX-10

168

This machine signals Epson's launch into desk top micros. Peter Rodwell's findings look good.

EPSON FX-80

174

And while he's at it, Peter gives a new dot matrix printer the once over, too.

OSBORNE EXECUTIVE

176

An old hand at the Osborne, Guy Kewney, puts the new model under scrutiny.

EATURES

119

MICRONET 800

184

Computertown Thanet reports on an open day aimed at bringing microcomputers to the community.

DISKOGRAPHY

162

Jane & John Shemilt give helpful information on choosing suitable disks for your computer.

Maggie Burton asks whether this Prestelbased dial-up computer club and magazine renders the old forms of communications obsolescent.

TOP SECRET

190

Is this the code to end all codes? Cryptography by George Sassoon.

NETWORKING!

If you wish to interface any computer to almost any other computer or peripheral O.E.M. NETWORKS are probably the only company in the U.K. that have a working solution

(not next quarter).

We have developed the new INTERNET IV (any 2 machines/peripherals networking) and the new MULTINET 2000 range (6 to 120 machines/peripherals networked). Each port is programmable and we can link variable networks together on:-

MICRO'S

MINI'S

MAINFRAMES

So, if you are drowning in this pool:

ASCII, EBCDIC, Baudot, Hexadecimal codes, Asynchronous, Binary Synchronous transmission modes, Baud rates from 50 to 19200, X-on/X-off, ENQ, ACK, EOL Handshakes, odd/even parity, 2780/3780, 3270, CO3, MCP, DOS, RSTS/E, GCOS, OS1100. MVS, HASP, PRIMOS, VRX, EXEC8, RDOS

WE CAN SAVE YOU!

Call our hotline on 748 8404

PLUS!_ IBM. PC/SITUS 1. with up to 50 terminals.

Transfer of data files and programme files from almost any machine to any machine.

Come to our King Street showrooms to discuss your application and have a demonstration on:

olivetti M20

OSBORNE 1

and a whole range of printers.

The Extraordinary Epson Computer Family

OX10

A fully integrated Desktop Microcomputer system that takes the hardwork out of using software. An incredible new member of the Epson family.

Features:

- ★ Z80A CPU, VDU, and Keyboard units in modern lightweight, functional design.
- ★ 192K memory upgradeable to 256K RAM.
- ★ RS232C and parallel interfaces with multi-font BASIC as standard.
- ★ 5 optional interface card slots for Cassette, Barcode, Joystick, Sound Generator, Omninet[™] facilities. Also available is a universal interface card for developing your own interfaces.
- ★ 80 col x 25 lines screen with full bit image control.
- ★ 640 x 400 resolution graphics with 16:1 ZOOM and special effects including split screen facility.
- ★ Clock and calendar with battery back-up. TM Omninet is a registered trade mark of Corvus Computers.

HX20

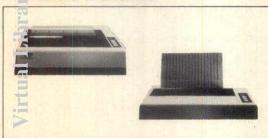

The full function, truly portable computer that slips into your briefcase, incorporating an LCD screen, full typewriter keyboard, printer and optional microcassette.

Features:

- ★ 20 character by 4 lines LCD screen.
- ★ A built in 24 column dot matrix impact microprinter.
- ★ 16K RAM which is optionally expandable to 32K, ROM expandable to 64K.
- ★ RS232C and serial interfaces.
- ★ Full size ASC II Keyboard.

STC Multicomponent can also offer a full range of accessories and several software packages in microcassette or pre-programmed ROM format.

EX80 & FX80 PRINTERS

Two exciting new printers that have the usual Epson qualities like reliability, modern styling and speed — and successfully surpass the performance of earlier machines.

The RX80 Features:

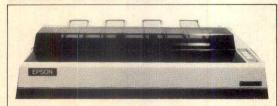

- ★ 100 character per second
- ★ Dot addressable graphics.
- ★ Condensed and double width printing.
- ★ Tractor feed for exact alignment.

The FX80 Features:

- ★ 160 characters per second.
- Proportional spacing, quick form tear off, superscripts, and down loadable character set.

Both printers have standard Centronics parallel interface with IEEE 488, RS232C etc optional interfaces.

MX 100 III

Another stylish and versatile printer from the Epson family.

- Features ★ 100 characters per second
 - Wide 15" carriage.
 - ★ Bit image printing.
 - 32 print codes standard.
 - ★ .Full 96 ASCII with decenders, 8 international character sets.
 - ★ Standard Centronics parallel interface with a variety of optional interfaces including RS232C, TRS 80 Model I, and Apple II intelligent parallel interface.

The new Lucas LX80 printer

Here's a new dot matrix printer that you will want to see and try – if only to confirm that what we claim for it is true.

The LX80 is ideally suited to educational, scientific and personal applications in conjunction with the Lucas Nascom 3 micro, and similar machines.

Phone your nearest Lucas Logic stockist listed below – or if in difficulty phone us on 0926 59411.

We're adding to our dealer list, daily.

FEATURES

● 80 characters per line, 10 characters per inch ● 80 characters per second bi-directional printing ● Dot matrix print using 7 x 8 dots in an 8 x 9 matrix ● 228 ASCII character set includes normal and italic scripts ● Full graphics facilities – semigraphic characters and 640 bit-addressable dots per line, or compressed 1280 dots per line (7.5 inches) ● Software selection of print – normal, compressed (142 characters per line), double width (40 characters per line) and compressed double (71 characters per line) ● Subscripts, superscripts, underlining, emphasised and double print software selectable ● Vertical and

horizontal tab control, including variable line spacing, automatic form feed to preset length and perforation skip • Backed by Lucas

The Act 1 Sirius I is a revolutionary concept in personal computing for business, bringing a new meaning to the term Price/ Performance.

It offers users the 16 Bit performance normally associated with minicomputers but at a microcomputer price.

And it's backed up by the kind of 01 expertise and service that has made 01 one of Britain's top microcomputer Dealers.

Call us first on 01-228 2207, for a personal demonstration of the Act Sirius I. Remember, seeing is believing!

*ACT Sirius 1 128K RAM with 1.2Mb S/S Disks including CP/M-86, MS-DOS, (Run-time versions) & Microsoft Basic 86 £2,395

* ACT Sirius 1 128K RAM with 2.4Mb D/S Disks including CP/M-86, MS-DOS, (Run-time versions) & Microsoft Basic 86 £2,895

GEMINI SPECIAL FREE OFFERS

3 for the price of 2 - SAVE £19.95! 5 for the price of 3 - SAVE £39.90! 7 for the price of 4 - SAVE £59.85! (CASHBOOK & FINAL ACCOUNTS NOT INCLUDED)

CASH BOOK ACCOUNTS PROGRAM FOR BBC 32K, TORCH, SPECTRUM 48K

NEW.....£59.95

3000 31600 17150

One of the most innovative business programs on the market. Replaces a manual cash book system, e.g. Simplex and 'All-in-One'. Written by practising Chartered Accountants, this practical program is simple to use and will replace your manual cash and bank records. By giving you access to vital management information as and when you want it, it will enable you to keep more positive financial control of your business.

The software is extremely well and lucidly documented, and Gemini provide a full technical back-up and product up-date policy. Take a look at the information this program will provide:

Summary of VAT information for VAT returns * Cumulative receipts and payments report analysed over the standard

profit and loss and balance sheet headings * Option for departmental analysis of sales and purchases * Audit trail printout of all transactions. * Journal routine for entering transfers between accounts and year end adjustment for debtors, creditors etc. * Trial balance at any interval * Interfaces to 'Final Accounts' program to produce balance sheet and trading and profit/loss account etc. * Spectrum version may be used with Sinclair OR 80 column printer.

FINAL ACCOUNTS PROGRAM FOR BBC 32K, TORCH, **SPECTRUM 48K.....£59.95**

Requires Cash Book module. This program will take your cash book data to the logical conclusion of balance sheet, trading and profit/loss account and

notes to the accounts i.e. fixed assets, land and buildings and capital accounts. Final accounts (BBC version) links to 'Beebplot' for graphic data presentation

Format: Torch disk, BBC disk/cassette, Spectrum cassette.

Special Offer - Cash Book and Final Accounts together - £95

"Gemini's range of software is in the vanguard of the releases for 'serious' micro users...' (WHICH MICRO AND SOFTWARE REVIEW)

INVOICES AND STATEMENTS...£19.95

Compatible with most micros. See table. Ideal for the small business. A complete suite of programs together with generated customer file for producing crisp and

efficient business invoices and monthly statements on your line printer. All calculations include VAT automatically, and the program allows your own messages on the form produced. This program gives you superb presentation and saves time on one of the most tedious tasks in the office.

COMMERCIAL ACCOUNTS...£19.95

Compatible with most micros. See table. A gem of a program, all for cassette, with the following features: Daily Journal. Credit Sales. Cash Sales. Credit Purchases.

Purchases—other. Sales Ledger. Purchase Ledger. Bank Account. Year to date summary. A fully interactive program suitable for all businesses. Files can be saved and loaded and totals from one file carried forward to another on cassette. Particularly useful from a cash flow point of view, with an immediate accessibility to totals for debtors and creditors. Bank totally supported with entries for cheque numbers, credits and, of course, running balance.

MAILING LIST...£19.95

Compatible with most micros. See table. A superb dedicated database to allow for manipulations of names and addresses and other data. Gemini's unique 'searchkey'

system gives you a further ten 'user-defined parameters' to make your own selections. Features include the facility to find a name or detail when only part of the detail is known, it will print labels in a variety of user specified formats.

DATABASE...£19.95 Compatible with most micros. See table. The program that everyone needs, the most valuable and versatile in your collection. Facilities include sort search, list print if required. Can be used in place of any card index application; once purchased you can write your own dedicated database to suit your particular needs with a limitless number of entries on separate cassettes

STOCK CONTROL...£19.95

Compatible with most micros. See table. Dedicated software with all that's necessary to keep control of stock. This program will take the tedium out of stock control and save time and money. Routines include stock set up, user reference number, minimum stock level, financial summary, line print records, quick stock summary, add stock, delete/change record and more.

HOME ACCOUNTS...£19.95

Compatible with most micros. See table. Runs a complete home finance package for you with every facility necessary for keeping a track of regular and other expenses, bank account, mortgage, H.P., etc. This program also allows you to plot graphically by Histograms your monthly outgoings.

WORD PROCESSOR . . . £19.95

Compatible with most micros. See table. This program features routines found in much larger and more expensive packages with a typical word length of 5-6 letters it allows for around 1000 words in memory at one time. Ideal for the user who requires a simple program to write letters on his computer. Features include, block delete, block insert, search and replace, edit text, display text and more.

"Simple to use

ms for more computers!

SPREADSHEET ANALYSIS BEEBCALC £19.95 DRAGONCALC £19.95

FOR BBC AND DRAGON 32. Spreadsheet processors have proved to be important tools for using micros in business, scientific and domestic financial applications.

Without any programming knowledge at all, you may:-

Set up a computerised spreadsheet, with chosen row and column names.

Specify formulae relating any row or column to any other.

Enter your source data and have the results calculated.

Save the results on tape (or disk—BBC) for later reloading and manipulation.

Print the tabulated results in an elegant report format.

Experienced users may access saved files and write their own reporting or graphics presentation programs for the results.

Some typical applications:

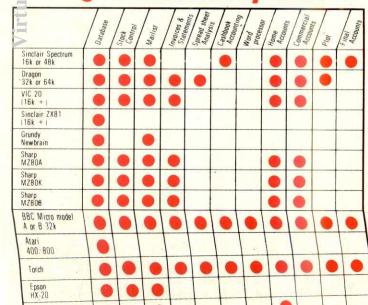

Small business accounting applications, e.g. profit and loss statements and ashflow projections, break-even analyses etc.

Investment project appraisal—anything from double glazing to oil rigs! Comparing rent/lease/buy options.
Processing the results of scientific experiments or field studies

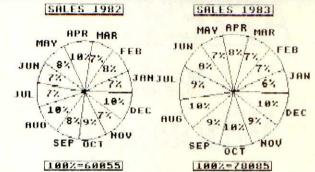

Engineering calculation models.

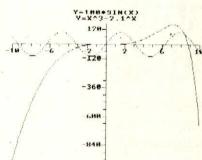

in fact, anything that involves repeated re-calculation of results presented in

Program Availability Chart:-

BEEBPLOT & SPECTRUMPLOT £19.95

Important new additions to the Gemini family. Present numeric and string data together in easilyunderstood pie chart, histogram or graph format. Beebplot has a built-in interface to Beebcalc, and both Beebplot and Spectrumplot have built in interfaces to the Final Accounts program of Cashbook. The facility for mathematical function

plotting is also provided. The BBC version has a high resolution screen dump for the Epson or CP-80 printers, and the Spectrum version dumps to the Sinclair printer via the 'copy' key. A very useful program that will give superb results either from direct input of data from the keyboard or via simple access to other software data files. A must for business and education.

WHEN IT COMES TO MICROCOMPUT SOFTWARE WE WROTE SOFTWARE CAPACOG THE BOOK

How do you stay up-to-the-minute with the rapidly changing world of microcomputer software? Get the Lifeboat Catalogue.

The latest innovations The new Lifeboat Catalogue is packed with the latest state-of-the-art software. And if we publish a new program after the latest catalogue has gone to press, we enclose a flash bulletin in

your copy.

The greatest selection

Because Lifeboat is the world's largest publisher of microcomputer software, our catalogue offers you the greatest selection of programs for business, professional and personal use. Our more than 200 programs range from the integrated accounting and professional practice systems to office tools for book-keepers and secretaries to sophisticated tools for programmers. Included are business systems, word processors, programming languages, database management systems, application tools and advanced system utilities.

We specialise in software that runs on most small business computers. Our more than 60 media formats, including floppy disks, data cartridges, magnetic tape and disk cartridges, support well over 100 different types of computer.

Get full service We give the crucial dimension of after-sales service and full support to everything we sell.

That includes:

- An update service for software and documentation.
- Telephone, telex and mail-order services in the London office and at overseas offices in the United States, France, Switzerland, West Germany and Japan.
- Subscriptions to Lifelines, the monthly magazine that offers comparative reviews, tips, techniques, identified bugs and updates that keep you abreast of change.

Get it now Lifeboat

now serves tens of thousands

of satisfied customers with our breadth of up-to-date, fully tested, fully supported and competitively priced software.

You may not need all we offer, but we offer just what you need. After all, we wrote the book.

For Line Surge Suppression

The SYSTEM SAVER provides essential protection to hardware and data from dangerous power surges and spikes.

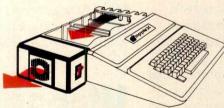

By connecting the Apple II power input through the SYSTEM SAVER, power is controlled in two ways: 1) Dangerous voltage spikes are clipped off at a safe 130 Volts RMS/175 Volts dc level. 2) High frequency noise is smoothed out before reaching the Apple II. A PI type filter attenuates common mode noise signals by a minimum of 30 dB from 600 khz to 20 mhz, with a maximum attenuation of 50 dB.

For Cooling

As soon as you add 80 columns or more memory to your Apple II you need SYSTEM SAVER.

Today's advanced peripheral cards generate more heat. In addition, the cards block any natural air flow through the Apple II creating high temperature conditions that substantially reduce the life of the cards and the computer itself.

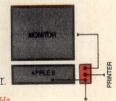

SYSTEM SAVER provides correct cooling. An efficient, quiet fan draws fresh air across the mother board, over the power supply and out the side ventilation slots.

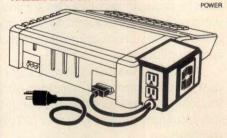

For Operating Efficiency

SYSTEM SAVER contains two switched power outlets. As shown in the diagram, the SYSTEM SAVER efficiently organizes your system so that one convenient,

front mounted power switch controls SYSTEM SAVER, Apple II, monitor and printer.

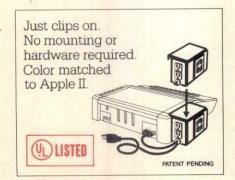

Available in 220/240 Volt. 50 Hz

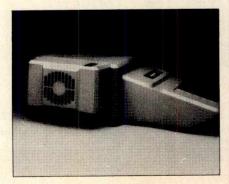

The heavy duty switch has a pilot light to alert when system is on. You'll never use the Apple power switch again!

Easy Installation

Compatible with Apple Stand

All these features have made System Saver the top selling Apple II and IIe peripheral in America. Now available at your local dealer. If yours doesn't stock System Saver yet, have him contact our distributor, Softsel Computer Products 01 844-2040.

Kensington Microware Ltd. 919 Third Avenue, New York NY 10022 (212) 486-7707 Telex: 236200 KEN UR

SMORGASBOARD

The only board your IBM Personal Computer may ever need.

SMORGASBOARD from Kensington Microware is a multifunction board for your IBM Personal Computer that greatly increases the capabilities of your PC while only using one expansion slot. SMORGASBOARD is completely hardware and software compatible with the PC. SMOR-GASBOARD combines the following 8 functions to enhance your IBM PC.

256K RAM MEMORY EXPANSION from 64K to 256K bytes in 64K byte increments. Additional memory enhances many software packages, including financial spreadsheets such as 1-2-3, VisiCalc and MultiPlan.

SERIAL PORT connects modems, letter quality printers and other serial devices. The serial port may be configured as COM1 or COM2. IBM PC communications soft-

PARALLEL PRINTER PORT Centronics compatible parware is fully supported. allel printer interface, is identical to IBM's Parallel Printer Adapter and may operate as LPTI, LPT2 or LPT3. This interface is plug compatible with standard printer cable. It can also be configured as a bidirectional SASI interface.

CLOCK/CALENDAR so you no longer have to input the time and date each time you reboot your PC. SMOR-GASBOARD's chronograph always keeps your system's

GAME PADDLES/JOYSTICK INTERFACE for attaching clock/calendar up to date. up to four game paddles or two joysticks to the PC.

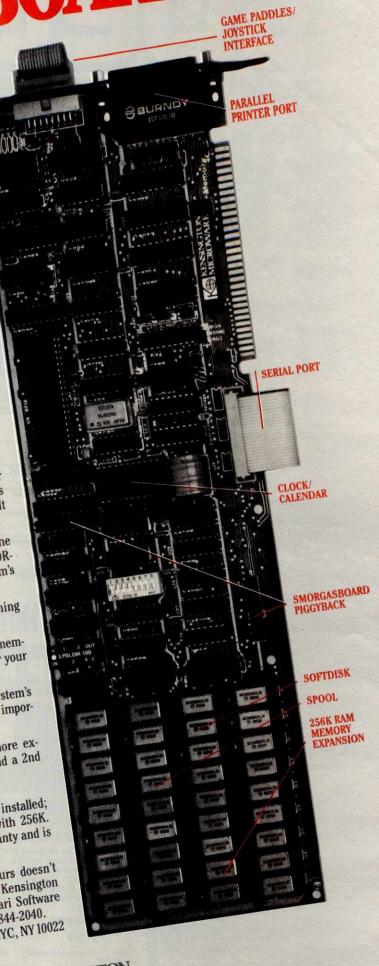

SPOOL software package uses part of the system's memory as a print buffer. You no longer have to wait for your

SOFTDISK program allocates a portion of the system's memory as a super fast electronic disk drive. Store imporprinter. tant information there for speedy access.

SMORGASBOARD PIGGYBACK offers even more expandability. With it another 256K bytes RAM and a 2nd Serial Port become available.

INCREDIBLE LOW PRICE: \$299 with 64K installed; \$399 with 128K; \$499 with 192K and \$599 with 256K. SMORGASBOARD comes with a one year warranty and is documented in English, French and German.

SEE IBM DEALERS EVERYWHERE. If yours doesn't stock SMORGASBOARD yet, have him contact Kensington Microware or one of our distributors—Ferrari Software 01 751-5791 or Softsel Computer Products 01 844-2040. Kensington Microware Ltd. 919 3rd Avenue NYC, NY 10022 Tel. 212 486 7707 Telex. 236200 KEN UR

If you're serious about your get some serious Software!

ematics - University of Belgrade Microcomputers weren't created just to play arcade games or to Alicrocomputers weren't created just to part in case games be left unused once you've learnt the basics of computing. Micros are amazing machines and have many serious uses, but they are only as

efficient as the software you run on them.
Esion are one of Europe's largest producers of microcomputer oftware with sales now exceeding one million packages. Our policy is to create quality software that takes full advantage of the processing power of your microcomputer and uses its capacity to the full.

We have now rewritten two of our most popular programs for use on the BBC Microcomputers (Model B or Model A with 32K RAM). Vu-Calc and Vu-File are powerful software packages that make practical and serious use of your microcomputer.

Supplied on cassette, they are designed for use with cassette or disk systems, and each program comes with a detailed user manual. Vu-Calc and Vu-File constitute essential software that no serious microcomputer user should be without.

he Versatile Spreadsheet Program

Vu-Calc is a powerful program that constructs a spreadsheet for generating and calculating large tables of interdependent text, ata and formulae.

A 'window' for viewing the spreadsheet can be scrolled in any direction so that the effects of ew figures and formulae on all the other data

an be observed.

Vu-Calc is supplied with a clear and detailed page user manual, and its hundreds of applications include:—

 Cashflow Projections • Home Finance anagement • Engineering and Statistical
lables • Investment Forecasting • Business
lanning • Profit and Loss Statements • Break dEven Analysis, and other complex calculation models £14.95

The Complete Filing System

Vu-File is a powerful data base management system that turns your microcomputer into a sophisticated general purpose filing system for manipulating information of all kinds. Vu-File can be used to create dedicated data bases to suit your most varied needs. Features

such as order, sequence, search, list and copy make Vu-File the most essential data handling software package available for microcomputer owners. Vu-File is supplied with a clear and detailed 16-page user manual, and its infinite applications include:—

- Catalogues of stamps, coins, books, records etc.
- Names and Addresses Mailing Lists
 Customer Accounts Estate Agents Lists
 Medical Records Club Memberships
 Records and Lists of all kinds.
- - £14.95

To the Retailer

Contact Psion to find out details of substantial discounts for trade orders of our best selling computer software.

Order Vu-Calc and/or Vu-File by using your Access or Barclaycard or send cheque/postal order for £14.95 per package to:-BBC Software Psion Ltd.,

2 Huntsworth Mews, Gloucester Place, London NW1 6DD.

Enquiries can also be made at W.H. Smith or your local retailer.

Please make cheques and postal orders payable to Psion Ltd., and allow 14 days for delivery.

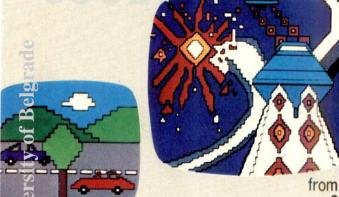

TO: BBC Software Psion Ltd., 2 Huntsworth Mews. Gloucester Place, London NW1 6DD. Please send me the following Software packages at £14.95 per package. Vu-Calc (£14.95 inc. p&p and VAT) Vu-File (£14.95 inc. p&p and VAT) *I enclose a cheque/postal order for £_ made payable to Psion Ltd. *Please charge my Access/Barclaycard Account Number NAME. ADDRESS.

those that don't

BASIC-I

tual Library of Faculty of Mathematics

The do's and don'ts of the new CGL M5 home computer reveal why it is such a remarkable family computer. Unrivalled in its range.

For those family members that do revel in creating their own personal computer programmes the M5 will test all their abilities. And teach them many more.

Alternatively for those that don't want to become so involved in programming the M5 couldn't be more fun.

How can one computer be all things to all users —

from a sixty year old to a six year old?

Simply because the CGL M5 has been developed in Japan as a sophisticated 'add-on' computer system. With the back up of a unique software system.

As your computer abilities grow so the CGL M5 will expand to meet them. One of the first things you'll discover about the M5 is

its amazing colour and graphic reproduction, whether it's bringing life to your own animation or pre-programmed cassettes and cartridges.

The graphic modes capability of the M5 is just one of the features that sets this computer in a class of its own.

It also incorporates a mini-synthesiser. Slot in the Basic G cartridge and you can compose to your ears' delight. The addition of a Basic F cartridge lets you do more complicated scientific, technical and arithmetical applications. There's also the FALC cartridge which gives you an easy to use data management and family accounting package.

And the CGL M5 is still growing. With an ever expanding library of

cassettes and cartridges.

Do yourself and your family a service — don't buy a home computer until you've found out more about the remarkable CGL M5.

and those that might.

For full details and a technical specification of the new CGL M5 send us this completed coupon. Apart from the full-colour brochure we'll also rush you the address of your nearest stockist. Be sure to see a demonstration.

The CGL M5. It might be the best family decision you'll make for years.

THE BATTLE IS OVER...

"MS-DOS has become the dominant 16-bit operating system . . ."

Computing, 17th February '83

"... now it is clear that MS-DOS is the runaway winner."

Weekly Micro Bulletin, 21st February '83

"MS-DOS ... has virtually stopped the runaway success of Digital Research's CP/M in its tracks."

Infomatics Daily Bulletin, 14th January '83

"Digital Research . . . may be too late to stop the landslide."

Personal Computer News, 20th May '83

"In quick succession, more than 50 other computer hardware manufacturers picked Microsoft's operating system. As a result, MS-DOS has virtually shut CP/M out of the market for newer, more powerful microcomputers."

Business Week, 21st February '83

When it's time to stop playing games and get down to business...

Unfortunately, many of today's desk top computers are designed with too much emphasis on home use. That's fine, if you want to balance your checkbook, play "space war" or draw pictures. But when you have serious business requirements for a computer, you want one designed specifically for business

The RAIR Business Computer is just that. A computer designed specifically for business applications, incorporating a host of features—optimised for the business environment. 8- and 16-bit microprocessors allow users to run available 8-bit—plus newer 16-bit—applications software simultaneously. And an integral high-capacity Winchester disk drive—plus provision for additional hard disk support—provides sufficient on-line storage for virtually any business application.

Advanced communications software allows the RAIR Business Computer to connect to mainframe systems and networks. And expanded RAM memory supports simultaneous access from up to four user workstations, each including an ergonomically designed, detached keyboard, high-resolution colour display, and optional workstation printer.

So if you're serious about a computer for business, call RAIR for details about our Business Computer. We're not playing games. RAIR Limited 6-9 Upper St. Martins Lane London WC2H 9EQ Phone (01) 836 6921, Telex 298452

SYSTEM SPECIFICATION

Microprocessors: Concurrent 16-bit 8088 plus 8-bit 8085 RAM Memory: 256 kbytes expandable to 1024 kbytes Integral Disk Storage: 19-Mbyte Winchester drive plus 1-Mbyte flopoy drive

Storage Options: Up to 4 add-on Winchester drives plus streaming tape backup

Communications: 4 workstation ports (RS-422-compatible), plus 2 synchronous/asynchronous programmable RS-232 ports

WORKSTATIONS (up to 4)

Keyboard: Ergonomic, low-profile, 83 keys, 10 programmable function keys, 10-key numeric keypad (with cursor/editing functions)

Color Display: High-resolution, 80 characters x 25 lines, upper and lower case, 8 programmable foreground/background colors.

Printer: Bidirectional, 160 characters-per-second, friction and tractor feed

SOFTWARE

Operating System: User-friendly, multi-tasking, CP/M MP/M, PC-DOS compatible

Languages: BASIC, COBOL, Pascal

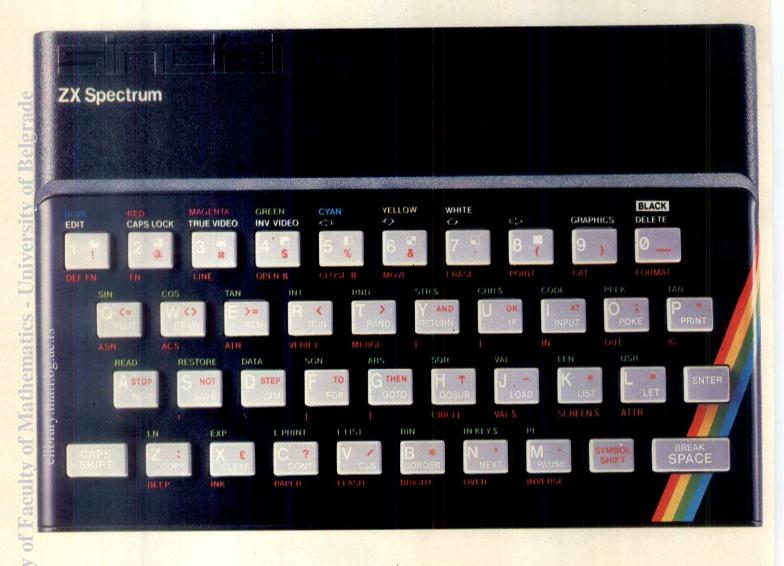

Applications: Spreadsheet, Database, Text Processing Communications

Sinclair ZX Spect

The growing range of Spectrum Software

You'll know already that the Spectrum has generated an enormous range of peripherals and independent software. Our own range is growing very fast and is shown in the Sinclair Software Catalogue – free with every ZX Spectrum.

rum-news!

6KNOVV 599-95 Previously £125.

At last, a 16K colour computer with graphics for under £100! Why have we done it?
Partly because the sheer volume of Spectrums sold (over 300,000 so far) has brought down unit production costs.

And partly, of course, because we hope you'll buy a Singlair computer – and not some competitor's promise! We've all heard about colour computers breaking the £100 barrier. Here's the computer that's done it. A colour computer with advanced graphics that's fully supported, and widely available.

Right now, you can order a Sinclair Spectrum at these prices direct from Sinclair on the order form below. And to make it even easier to handle high-level computing at the

lowest possible price, we've cut the cost of the printer, too. At £39.95, it's almost unbelievable!

At prices like these, there's really no reason to wait.

ZX Printer now £39.95
Previously £59.95

16 BIT BUSINESS SOFTWARE

Virtual Library of Faculty of Mathematics - University of Belgrade elibrary.matf.bg.ac.rs

PULSAR business software is the creation of ACT – the company behind the Sirius 1 and recognised leader in 16-bit personal computing.

The new PULSAR range, developed by ACT area cost in excess of £1 million, takes full advantage of the power and expandability of 16-bit computers.

It is inherently faster and more powerful than traditional 8-bit software.

And it is a true 16-bit range, designed and developed by ACT's own software engineers.

PULSAR offers more of all the key requirements in business software:

MORE PORTABILITY

Written thoughout in machine-independent pertable languages to protect your software investment.

LONGER PEDIGREE

ACT has more than 17 years experience in developing business software. Thousands of companies throughout the world use ACT packages.

GREATER INTEGRATION

All the PULSAR packages are designed to slare information, avoiding duplication of files and eliminating re-entering of data.

MORE USER-FRIENDLY

ACT's unique UFO (user-friendly organization) routines allow even the inexperienced user to quickly and easily configure a PULSAR system to precise requirements.

BETTER TRAINING

Two training centres, in London and Birmingham are open to all PULSAR users.

MORE SUPPORT

A ''hot line'' telephone support scheme to instantly resolve any operating queries.

PULSAR SOFTWARE CENTERS

Only PULSAR is available through the unique network of PULSAR Software Centers. These are hand-picked computer dealers who handle a range of personal computers but who specialise purely in PULSAR to meet all business needs.

THE PULSAR RANGE

Sales Ledger	£195	Informer Database	£295
Purchase Ledger	£195	Micromodeller	£595

Welcome to the ICE Age inchester Sub Systems with a tape streamer back up

ICE

From 3 to 42 Megabyte configurations

Compatible with

Apple II . Apple III . Superbrain . Sirius/Victor . I.B.M.P.C. . 5100 . Z80 based Systems Tapestreamer backup now available for Profile. Apple III hard disc.

For further information or a demonstration contact:- ICE 16/18 Littleton Road, Ashford, Middlesex TW15 1UQ. Telephone Ashford (07842) 47271/47171 Telex 8952042 (DP CUST G)

From F135

Although the NewBrain is conceived as a total system, the unexpanded Processor itself has a great deal to offer. It is available in two forms: Model AD, shown below, with a built-in line display; and Model A, without the line display. Both models can operate with a monitor or a television set.

MEMORY

- □ 24K bytes of ROM;
- □ 32K bytes of RAM, at least 28K of which is available to the user.

THE SCREEN DISPLAY

- 40 or 80 characters to the line without affecting the 28K bytes of RAM at your disposal;
- □ 24 or 30 lines to the screen;
- well-formed characters, with true descenders;
- a full European character set;
- normal or reverse video, high resolution graphics on screen of controllable size, 256, 320, 512 or 640 horizontal resolution by 250 vertical lines;
- a facility to set up a "page" of up to 255 lines, with the screen acting as a "window" to display it;
- ability to maintain several such pages simultaneously, and to switch rapidly between them;
- a text may be used on graphics screen as well as on parts of the video screen not used by graphics.

CHARACTER SET

□ 512 characters, including the full ASCII set, all European accented characters, Greek and graphics symbols.

GRAPHICS

- 20 powerful graphics commands;
- all text characters usable on the graphics screen;
- variable-sized graphics screen, with the rest of the screen available for text for versatility and to save memory.

CP/M IS A REGISTERED TRADE MARK OF DIGITAL RESEARCH INC

SOFTWARE

Enhanced ANSI BASIC; screen editor (32 commands); mathematics package (10 significant figures); graphics commands.

- a very friendly screen editor a delight to use and readily adapted to text processing;
- arithmetic to 10 significant figures;
- very controllable output formatting of numbers invaluable for accounting, statistics, and scientific applications;
- a powerful, much enhanced BASIC;
- a very flexible operating system, which allows any data stream to be opened to any device.

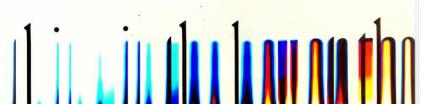

INTERFACES

- u two tape cassette ports built into the processor unit;
- a built-in printer interface;
- abuilt-in communications interface (V24/RS232);
- a video monitor interface;
- □ a TV interface;
- an expansion interface for NewBrain system expansion modules.

KEYBOARD

 standard typewriter pitch, action, layout and size, with editing control and graphics keys.

Multi-Index from Bonsai.

The first Integrated Accounting Software for micros designed for real world business.

Multi-Index is a new generation of sophisticated Accounting Software. A completely integrated system written entirely in RM/COBOL, a professional business oriented language. It makes systems written in BASIC look pretty

Multi-Index consists of seven fully integrated modules: Sales, Purchase, VAT and Nominal Ledgers, Stock Control, Order Entry/Invoicing and Sales Analysis, with several additional modules to be released soon. Multi-Index provides the ultimate combination of sophistication and ease-of-use. Entirely menu driven, easy to follow screen displays lead inexperienced operators step by step through all procedures so Multi-Index is quick and painless to learn.

Multi-Index presents features up to now only available on mainframes. Features like:

Up to 13 open accounting periods with full detail accessible throughout the year.

A financial statement report generator producing all statements including Sources & Applications of Funds, Balance Sheet, P & L and supporting schedules to your own format.

 Multiple-location stock control among unlimited branches with full stock transfer support.

Access to customers, suppliers and stock items by name if the account or stock number is not known.

Flexible price discount schedules, plus automatic calculation of salesmen's commissions, settlement discounts and finance charges.

No time-consuming sorts anywhere in the system. Feature for feature Multi-Index beats all other micro for many 8, 16 and 32-bit microcomputers running CP/M-80, CP/M-86, MS-DOS and Unix including the latest hardware like the IBM Personal

MICROCOMPUTER SYSTEMS FOR PEOPLE IN BUSINESS.

The box is not always black...

At Rair we're continually enhancing and upgrading our Black Box microcomputer range to meet the everchanging, ever-growing needs of our customers.

That's why you'll often find our systems turning up under different names, different colours – not always black.

Our current Black Box range includes 8- and 16-bit

single-user floppy disk systems right up to powerful multi-user systems with Winchester hard disks and tape backup.

So next time you're choosing a microcomputer for a new application, remember to call us first.

With Rair you can have an

Peachtree Software

The gilt edged investment for your microcomputer

You need to be sure that the application software you choose carries the hallmark of stability and reliability and will be a sound investment for the future. It should enhance the value of the microcomputer you select to solve your business problems.

The Peachtree Portfolio of Application Software meets this need. The range provides for simple book-keeping (Peachtree Basic Accounting Systems), comprehensive accounting (Peachtree Business Management Systems) and integrated office automation (Peachtree Office Productivity Systems).

Peachtree is part of the world's largest Application Software company. We have over 20 years experience helping users of large and small computers get the full value from the computerisation of their business.

THE SOFTWARE THAT WORKS FOR YOU.

Peachtree Software International Limited 43-53 Moorbridge Road, Maidenhead, Berkshire SL6 8LT, United Kingdom Telephone: Maidenhead (0628) 32711. Telex 849000

A nationwide network of independent computer retailers offers our portfolio of products on many different types of microcomputer. These companies provide the local support you want - backed up by Peachtree.

Major microcomputer manufacturers and distributors have made their investment in Peachtree Software for their computers.

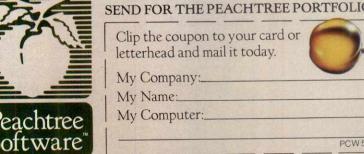

They include:

IBM DIGITAL BRITANNIA, RANK XEROX, PHILIPS, OSBORNE. POSITRON, OEM, EPSON, GRUNDY, WANG, MEMORY,

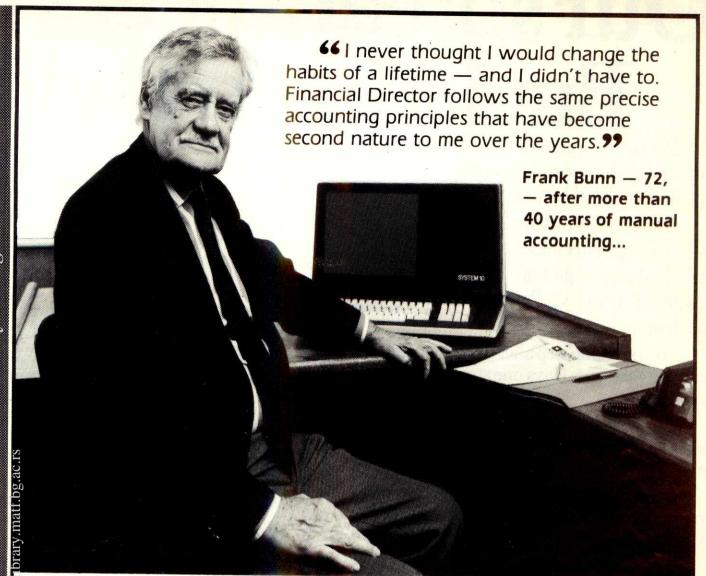

SAMURAI (distributed by Micronetworks) SANYO and ALTOS (distributed by Logitek)

Peachtree Software is available for these machines through their own distribution networks - backed up by Peachtree.

SEND FOR THE PEACHTREE PORTFOLIO:

More and more people are finding FINANCIAL DIRECTOR is Right for their Business

Financial Director is a complete business book-keeping and accounting software package for small and medium-sized businesses and proven in two years' field testing. Financial Director has been designed by professional Accountants and conforms exactly to British Accounting principles with essential items such as automatic double entry and a complete audit trail which are fundamental to successful computer accounting.

Financial Director has been described as the 'accountant in a briefcase' — partly due to its unique presentation, partly because it provides the financial control skills of the professional accountant and enables the businessman to keep totally up-todate with the progress of his business.

Financial Director works on most business micro's and is available from good computer dealers all over the country.

We recommend that you consult your accountant and implement your computer accounting system with professional assistance.

For full information and details of our training schemes and dealer network — call today.

Our spreadsheet sys But let's start with

Today, computers, micros and more importantly business planning systems are no longer considered luxuries

They allow you to make better decisions by providing better information on budgeting, cash flow, project profitability, Acquisition Appraisal, Lease vs Purchase analysis and much more.

You stay one step ahead of your business and your business stays one step ahead of the competitors.

But which system should you buy? Surely no one system can meet the needs of all Dusinesses?

Fortunately Comshare is not like most companies. We see the need for different systems to suit different people.

NEW USERS START HERE

PlannerCalc at £85.00* is now accepted as the first choice for people new to financial planning.

Designed for 8-bit micros, it boasts the kind of features that you'd expect to pay twice as much for. (Buy PlannerCalc's nearest rival and you'll have to.)

Unlike all other 'calc' products it allows you to enter calculations in a language you understand. Plain English.

For example:

LINE 1 SALES=100, 150, 175, 210

LINE 2 EXPENSES=GROW 70 BY 15% FOR 4

LINE 3 NET=SALES-EXPENSES

LINE 4 CSALES=CUM SALES

COLUMN 5 YEAR=SUM OF COL 1 THRU COL 4

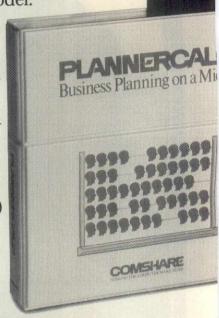

So it's much easier to use.

It uses the popular "spreadsheet" approach with a window that can be rolled in all directions.

Which means you can enter now former and rules and

immediately see their effect on everything else in the model.

It comes with the best manual on the market and it's suitable for most micros with a™CP/M 2.2 operating system, 64K of memory, giving at least 900 cells, minimum screen width of 80 characters and 2 floppy disc drives.

MUCH MORE POWER, NOT MUCH MORE MONEY

MasterPlanner is the most powerful spreadsheet system currently available with its increased matrix size, 2000-3000 cells on most 64K micros. (But at £245* it certainly isn't the most expensive.)

Consolidation of models, allows you to create separate plans for each department and then combine them into an overall company

tems start at £85.00. why you need one.

plan. Data transfer to word processing and other systems lets you incorporate figures in reports and output to a data base. It also has extensive formatting facilities which means you can produce reports that wouldn't look out of place in the board room.

It can store up to 25 standard reports to run when you need them. It's got full WHAT IF? analysis and direct editing of both spreadsheet and logic display.

JUST AS EASY TO USE

All this increased power doesn't mean you'll need a degree in advanced computing to understand MasterPlanner.

It works on exactly the same system as PlannerCalc and models written on PlannerCalc run without modification on MasterPlanner.

16 BIT VERSION

A new version of Master-Planner has been specifically designed for the 16 bit micros like the Sirius 1 under ™CP/M-86 or the IBM personal using either CP/M-86 or ™MS DOS 1.1. With a vast matrix size of over 7000 cells on 128K and even more with larger memory, you'll at last be able to make the most of your micro.

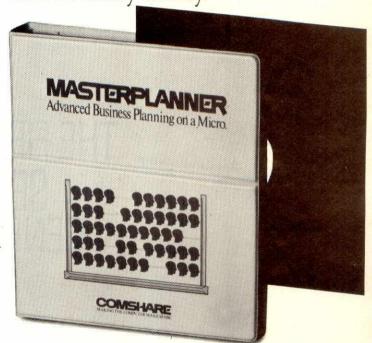

ULTIMATE POWER

Fastplan is the top Comshare micro planning system.

It's file-based, allowing development of large scale models; with a staggering 18,000 cell matrix; full financial functions plus back-

OVER 10 YEARS EXPERIENCE

When you invest in MasterPlanner or PlannerCalc you're not just getting the best software money can buy.

You're also getting the kind of back up and after-sales service that only a company of Comshare's track-record can guarantee.

If you'd like to know more about any product, call in at your local dealer or fill in the coupon and send it to us.

THE FIRST OF THE SECOND GENERATION

Earlier this month *Tomorrow's World* carried its first ever news story about a piece of software. Whilst not of earth shattering importance to the man in the street, this event marks the beginning of a quiet revolution that the experts have been predicting for months. The time has come when standardisation is forcing hardware into the background, leaving the spotlight on software.

Whether you use a micro for playing games, running a business or just learning about computers, the software you buy and use will make or break your relationship with your machine.

And just how well do the existing micro magazines serve your needs once you face that fact? Not very well at all.

That's why we're launching SOFT, a brand new monthly magazine

to software. Totally committed to reviewing more software, in greater depth, than any other magazine. And totally committed to facing up to the role that software plays — where it matters — at the man/machine interface.

As the publishers that took *Personal Computer* World to the number one slot in the market and that

launched the marketleading trade paper *MicroScope*, we can promise the first radically new approach to micro magazines in five years.

Just as we led the first generation, we intend to lead the second.

The first issue of SOFT will be on sale at all good newsagents from 20 May.

And we are offering very special subscription rates to charter subscribers who apply before

CHARTER	SUBSCRIPTION	LOFFER
GHAITLI	SUDSCIIII HUIV	ULLL

I would like to apply for a charter subscription to SOFT for one year (12 issues) I understand that this entitles me to 12 issues for the price of 10.

THE WISE MAN'S CHOICE

THE SAGE family of computers is expanding! Added to the special of the new special of the specia SeGE IV. Both machines provide pewer from the Motorola 68000 cop which is a true 16 bit pro-

micro-computers. Configurations now extend from memory of 128K to a massive 1 Megabyte, and storage systems from 640K to potentially 200 Megabytes of Winchester disk.

SAGE software is expanding! There is now a choice of four operating systems for the machines. The standard UCSD p-System (complete with Pascal, FORTRAN, and BASIC compilers) is now available in a multi-user form for the SAGE IV which has ports for six users.

cation software. With the implementation of RAMDISK, BOS runs twice as fast on the SAGE as any previous machine, and the list includes some sizeable mini computers!

CPM is available. What more to say except that Digital Research now give their blessing to SAGE with their CPM68K system. This comes complete with a 'C' compiler and will allow UNIX software to be compiled and run under the CPM environment.

SAGE Application software is expanding! Many of the major Apple Pascal system houses have opted for the SAGE as their development machine (remember it goes 14 times as fast as an Apple), and our software directory is getting very large, with a choice of Accounting programs, Modelling programs, Database programs, Project monitoring systems, and a host of software for specialist applications. As we say it's rather hard for anyone developing soft-ware to look away from SAGE because it makes other so-called 16 bit computers look pedestrian.

SAGE draws pictures! An interface to the PLUTO graphics system gives superb high speed, high resolution graphics in eight

> MicroAPL offer their MIRAGE APL system on SAGE computers, and again the SAGE delivers performance only previously found on mainframe or timesharing systems.

Every SAGE shipped is complete with ONE YEARS ON-SITE SERVICE from GCS Engineering who have over 120 field engineers, so 24 HOUR CALLOUT means just that.

SAGE is affordable! SAGE prices start at under £3000 and a typical 4 user system complete with Winchester disc AND terminals is under £7500. Wise men need to be convinced! Call your local dealer today.

TEL - 0272-742796

If you understand the facts and figures on the left you'll soon realise that New Brain has to be one of the most powerful micros around.

However, if you find the box on the left a little hard to follow, don't worry.

We've got over 120 dealers nationwide who've got all the answers at their fingertips.

Either way you'll discover that NewBrain as the kind of micro that will stop the competition getting a look in.

At £269 it starts off with twice as much memory as most of its competitors and can expand to over thirty times that amount. So there's no chance of being left behind in the micro race.

🚆 省 It comes with a very powerful language erhanced ANSI BASIC) and it'll take CP/M. so I'll work on the same system as similar big business micros, giving you the capacity to use an almost limitless variety of tried and tested software.

But most of all NewBrain is a machine. ∃hat can expand.

It's designed to take disks, printers and memory expansion modules (up to 2M bytes) plus anything else you'd expect a professional business micro to handle.

So, whether you understand the box on the left or not, pay a visit to someone in the know on the right.

They'll answer all your questions and give you a full demonstration.

Keep on running

The name on the world's best selling dot matrix printers is Epson. That's because more and more people every year are proving for themselves that Epson printers are the cost performance leaders.

R & D committment

It's the research and development Epson put behind every machine, using only the latest micro technology, with fewer moving parts, that has made their printers world beaters for performance plus reliability.

And that's backed by a 12 month guarantee for real peace of mind.

RX 80 - the personal printer

The new Epson RX 80 takes the proven MX series technology even further, setting the pace once again in fast 100cps printers with features that make its low price tag look even smaller.

Bit image graphics, a wide variety of programmable character sets and print styles, and a selectable

50cps quiet mode make the RX 80 a printer advanced enough for any office, yet affordable enough for the personal computer budget.

FX 80 - the versatile printer

If you need even faster hard copy, the Epson FX 80 will give you all you need in a dot matrix printer.

With print speeds of up to 160cps, with an 80cps quiet mode, the versatile FX 80 will power through all your printout with ease. But that's not all. Versatility means

being able to handle up to 256 user defined characters, variable line spacing that's switchable or programmable, and a choice of typefaces.

And that makes the FX 80 a printer that's way ahead of its class at any price.

Fast response too – from Midlectron

Fast selling printers like these need a distributor like Midlectron – because we hold enough stocks to deliver off the shelf, with a nation-wide dealer network so you won't have to go far to get your hands on an Epson.

For your nearest dealer, technical support, or OEM pricing, phone Midlectron today.

ots of micro magazines

pretend to take computer
games seriously.

But seriously, as a person
with the perspicacity to read
this magazine, you know better.
Yet you still want to play games
with your micro, rather than let
your micro play games with you.
So that's why from July

onwards, you can buy a special magazine

published by VNU called 'Personal Computer Games' which will help you do just that.

No matter what micro you own, 'Personal Computer Games' will tell you everything you've ever needed to know about the games you can play with your micro.

And the wherewithal of playing them.

Make sure you don't miss out. Shoot on down to your newsagent, or use the coupon below to order your copy. Now!

And start winning, winning, winning.

Subject to availability. All prices include VAT unless shown. Prices correct at time of going to press.

Now you can buy a QUAD function IBM PC board without having to buy more memory.

MegaPlus™ and I/O-Plus-2™ are the ultimate add-on products you will need to expand your IBM PC and XT. Which board you decide on will depend on where you are heading. To take full advantage of your IBM PC and XT beyond 256k, you will want to expand with the MegaPlus™. It's features include two asynchronous ports, clock/calendar, printer port, and up to 512k of memory expansion. But what if you already have all the memory you need? The I/O Plus-2™ gives you all the features of Mega-Plus™ to operate your printers, plotters and modems, set your time and date automatically with the clock/calendar, without adding memory. Also a special game adapter is available, but more about that later. Both boards include SuperDrive™ disk emulation and SuperSpool™ print buffer software.

MEGA WITH MEMORY

The MegaPlus™ has three functions standard: Parity checked and fully socketed memory up to 256k in 64k increments; clock/calendar with battery back-up for automatic loading of time and date when the computer is turned on; and an asynchronous communication port (RS232C serial) which can be used as COM1 or COM2, (DTE for a printer, or DCE for a modem). Optional is a 100% IBM compatible parallel printer port, and a second asynchronous port for another £30 each. The MegaPak™ option plugs onto your Mega-Plus™ "piggyback" style to give you 512k of additional memory. Now you can create disk drives in memory up to 360k, set aside plenty of space for print spooling, and still have memory for your biggest programmes.

I/O-PLUS 2 WITHOUT MEMORY

The I/O-Plus 2™ comes standard with a clip-on battery powered clock/calendar, and asynchronous communication port (RS232C serial). Optional is a second asynchronous port (DTE for a printer, or DCE for a modem), a parallel printer adapter, and the best game paddle adapter on the market. What's so special about our game adapter? Not only is it an IBM standard game port, but it can also use low cost, widely available Apple compatible paddles and joysticks. If you already have sufficient memory the I/O-Plus 2™ gives you all the input and output ports you might need for less than the cost of most single function boards.

FREE SOFTWARE

SuperDrive™ disk emulation software creates "disk drives" in memory which access your programmes at the speed of RAM memory. SuperSpooler™ print buffer software allows the memory to accept data as fast as the computer can send it and frees your computer for more productive work. Some manufacturers sell hardware print buffers that do only this for hundreds of pounds. SuperSpooler™ eliminates the need for these slot robbing products. Both of these powerful pieces of software can be used with any expansion memory for your IBM PC or XT.

CHEAP SOFTWARE TOO

What good is great hardware without some great software to use it with? We offer some terrific prices on some of the popular programmes you will want to use your board with. How about the cream of the spreadsheet programs, SUPERCALC, for just £129, or SUPERWRITER for £199. If you are looking for data base management you can get dBASE II by Ashton-Tate for £369.

WHY BUY IT FROM US?

Because we provide the service and support most companies just talk about. Each board is fully tested and burned in prior to shipment. We realize how integral this board is to the use of your computer. What good is a warranty if it takes weeks for repairs to be made? We offer 48 hour turnaround or a replacement board on all warranty repairs. Do you hear anyone else making this promise? If you still are not convinced, and want to compare prices, remember we don't charge extra for credit cards, shipping, or COD fees. We think the ultimate testimony to our good service and high quality is that one of our largest customers is none other than IBM! If you still want to buy elsewhere, ask any competitor if they will face the acid

THE ACID TEST

Qubie' (say que-bee-A) gives you a 30 day satisfaction guarantee on all board purchases. If you are not completely satisfied we will refund the entire cost of your purchase. If you can get one of our competitors to give you the same guarantee, buy any other board you think compares and

return the one you don't like. We're not worried because we know which one you will keep. We also offer a one year parts and labor warranty. An additional one year extended warranty is available for £35.

TO ORDER BY MAIL SEND:

- -your name and delivery address
- -board type, size, and options requested
- -daytime phone number
- -UK Residents add 15% for VAT
- Company check or credit card number with expiration date (personal checks take 10 days to clear)

PRICES:

I/O-Plus 2[™] with Clock/calendar, asynchronous communication adapter, SuperDrive[™] and SuperSpool[™] - £115

MegaPlus™ with memory, clock, async, SuperDrive™ and SuperSpool™ software: 64k £249

DEALER ENQUIRIES INVITED

The MIMI 803 is a supreme example of high quality British engineering. It is a truly professional microcomputer that really does meet all the criteria of a sophisticated business machine - at a price you can afford.

Our competitors expect you to make do with the basics and then buy expensive extras in order to fulfil your needs. The MIMI 803 has all the 'extras' as standard - so when you buy a MIMI you really are getting a microcomputer that will do the job from the outset.

The MIMI's operating system OS/M[†] is fully compatible with CP/M[‡] 2.2 in all system calls and functions. This ensures that you have access to the comprehensive range of Software currently available in the open market.

During the next few months we will be announcing the availability of TROJAN - a major software innovation that totally simplifies the learning process and use of micros, and dramatically eases the creation of new applications software in record time - so we can guarantee its performance.

Don't settle for less... contact us or one of our dealers now.

Features include:

- Z80A at 4MHz
- 64K dynamic RAM, plus additional 16K RAM for the graphics
- Integral D/S D/D 51/4 ins floppy discs 800Kb.
- Full RS232C and Centronics parallel ports
- 96 Key ASCII keyboard colour coded.
- 17 programmed function keys.
- Elegant compact and light 24 lbs
- OS/M[†] operating system CP/M[‡] compatible.
- Disc format conversion facility
- Wide range of software, utilities and languages
- Super high resolution graphics (512 x 256 pixels).

And now with:

- Winchester disc option
- Choice of orange or green display

Silver-Reed-Right!

THE DAISY PRINTER OFFERING UNBEATABLE PRICE/PERFORMANCE
PLUS COMPATIBILITY WITH MOST POPULAR WORD-PROCESSING PACKAGES.

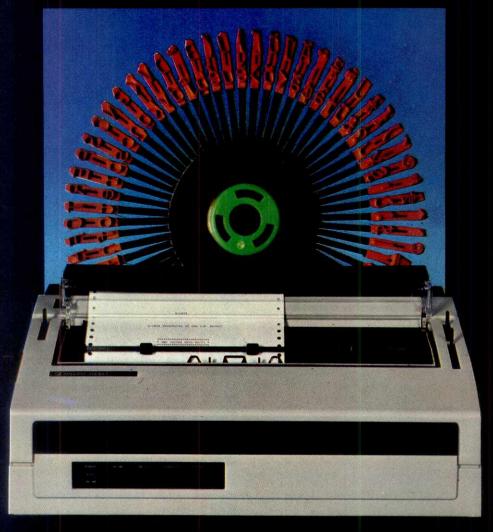

Superbly engineered, the Silver-Reed EXP550 provides the widest range of word-processing functions at a true entry-level price. Features include single pcb electronics and low compo-

nent count for ultimate reliability, and industry standard interfaces.

All backed by X-Data's renowned customer support service.

- 16 cps bi-directional
- original plus four copies
- up to 17in paper width
- easy-load cartridge ribbon
- quiet operation for office environment

Perfect print at a price you can afford.

Why should I bother with insurance?

Genie SuperCare is the first plan that can protect you for two years against breakdown repair cost.

Too day, high technology repairs can get alarmingly expensive. Skilled technicians with a first-class training are needed. Diagnostic service centres and special equipment do make the bills any smaller! Now, in the very unhappy event of a Genie breakdown, you can protect yourself against possible costly repair bills for 2 years. And have the option to extend cover for a further period if you wish.

Colour Genie

ase note: the policy does not cover overhaul, modification, repairs to por cosmetic firm, damage caused by wittul act or neglect, or loss of isured product or consequential loss of any kind.

Genie SuperCare lifts the worry right off your shoulders and places it back where it belongs. You will not get any invoices, nor any re-imbursement paperwork. Just take your Genie to your specialist Genie dealer and he will handle it all, direct. (Remember to keep the protective packing!)

Prepared by experts

Prepared by experts

The plan has been prepared by Lowe Computers, who distribute every Genie product in the U.K. from their extensive service and training centre in Matlock, Derbyshire.

In home electronics, they are the leaders. The plan is underwritten by Domestic and General Insurance Co. Ltd. They are the most senior in this field of insurance and are members of the British Insurance Association, your assurance of reliability.

What is covered?

Labour and parts for electrical, electronic and mechanical breakdown*, carriage by Securicor between your dealer and Lowe Computers or, in the event of a writeoff, re-imbursement at cost

Introductory offer: Backdated Guarantee
Until July 31, 1983, Genie SuperCare will apply to **all**Colour Genie and Genie III purchases, whenever you bought

Genie I and II will be eligible if purchased on or after January 1, 1983.

From the last day of July, only new purchases will be eligible – so, if you are a Genie owner, you owe it to yourself

This offer can never be repeated again, so contact your dealer at once, and spread the word to your friends.

Underwritten by:

Domestic & General Insurance Co. Limited

SPECIAL

BACKDATED **OFFER**

Genie III £60.00

There's a huge choice of micros around. Each with a different 'reason to buy

One might have fantastic graphics, but with a sound output like a pebble in a fin can.

Another may win every brownie point in the book on games. But with programming difficulties that make your brain ache (let alone your finger tips)

For your micro, it's no good having one star in the team. You need all-round performance that wins with flying colours (all 16 of them!). And backed by a knowledgeable dealer network that will help you explore the exciting world of micros.

THAT'S COLOUR GENIE

Owning one means that when you want to do something new, you won't have to throw away

months or years of experience. And you'll find that for whatever reason you first buy a micro - you'll develop new interests immediately!

It means that once started, you can progress to be an experienced programmer. From fantastic games, to professional program applications.

SOUNDS CHALLENGING?

It's meant to! Because Colour Genie is fast and powerful enough to offer you the most exciting challenges in entertainment and education, at home and at work.

PROGRAMMABLE

Fast Z-80 chip with very pro-grammable Microsoft* BASIC Extended held in 16K ROM.

128 programmable characters with programmable screen for text and display. Plus 128 pre-set graphics on the keyboard.

4 programmable function keys in each shift plus auto-repeat on all 63

And to help cure any of your programming bugs - Colour Genie has a full, powerful editing facility!

MEMORABLE

On 16K RAM, virtually 90% is available for you to use. Rising to a staggering 95% with the 32K RAM option. That indicates design efficiency and some very experienced programming. It's not RAM size that

counts - it's the usable RAM that matters!

ADAPTABLE

Screen text display is a full 40 across x 24 down. In this mode you can build highly complex graphics. Using the highest screen resolution of 320 x 192 with both text and graphics

With up to 16 colours on screen (8 colours and 8 hues), get the shapes to 'move' over the screen with a 3D effect. Or you can use full-screen high graphics resolution at 160 across x 96 down in 4 colours with background programmed graphic building blocks' plus 128 more that you

Colour Genie Quite simply, More ... able

Available, and affordable! Only £194

(including VAT)

Send NOW for full details.

I FARNARI F

Colour Genie even comes with 2 manuals. A beginner's guide, and one to take you through the first steps of BASIC, the English 'shorthand' that the computer understands (shown here with optional joystick

SOFTWARE AVAILABLE

Find the Diamond of Balmarion The Vegan Incident Enchanted Garden (requires 32K) Tood Mania! Space Fighters Racina Driver Mysterious Adventure Series (7 programs) Invaders from Space The Chomper

Cosmic Attack Zen Editor/Assembler/Debugger Genmon

Fortress of Evil The Exterminator
The Graphics Master The Deep Double Agent Electric Etch

Electronic Organ reak-Out (Joysticks) Morse Code Trainer

File Handling Lifeboat & Noughts and Crosses Round Table (Adventure) C.G. Copy Murder at Gosforth Hall (Like Cluedo)

Galactic Attack Mousemaze Asteroid Mission CSAVERS (Genie 1 to 4 Basic Trans.) Monitor 3

Missile Strike

Maths Practice Program CORPLAN (Business and Educational Software) Character Generator (2 games on reverse side)

Word Processing Wolf Tracks

COMMANDABLE

SHAPE, SCALE, COLOUR, PAINT, CIRCLE, FILL, PLOT - the list goes on with more than 80 others.

Add more than 40 graphic, arithmetic and other functions. You can see the power behind Colour Genie

culty of Mathematics - University of Belgrade

COMPOSABLE

Outstanding facility with 3 sound generation channels. Independent or simultaneous with a full range of 8 octaves on each channel to give the synthesized sound of instruments such as drums, flute and harpsichord. A bomb, a car or a bird!

Programmable pitch, duration and volume

White noise. Special effects Full enveloping. Plays through your TV or Hi-Fi (with picture on TV). SOUND AND PLAY commands

USEABLE

There's no shortage of actionpacked games available now. But as your expertise develops, you'll find Colour Genie software to meet your growing skills. From some of the best writers around

Education, music, business and many other applications.

Regular software update lists. Backed by Lowe Soft, the special Lowe Computers software service. All you need to get the most from your Colour

ENJOYABLE

Your optional Colour Genie joysticks must be the best in the business!

Slam them hard for explosive screen action. Touch them gently for slow precision. They each use a 6-bit chip and convert from normal analogue to digital response.

And each stick has a built-in numeric pad to help build exciting two player applications.

SHARE-ABLE

The National Colour Genie Users' Group welcomes you! Free magazine every month for the beginner and the pro. Where to get software. Its own software library. User experiences, and the opportunity to sell your software on the Group's own label

GUARANTEE-ABLE

Our optional 2-year breakdown guarantee underlines the reliability of Colour Genie. Only £16.50 from date of purchase.

UNDERSTANDABLE

For everybody new to computers, all the technical words are a bit of a mystery. But for Colour Genie, you'll find excellent books which take you from wiring in the plug to how to get the best from the computer!

Give us a call and we can update you on current titles.

Happy computing!

Alacse Send the full Colour Regreed servicinst Decies.

Official Roberts (1985)

GALAXY 2 COMPUTER

WHATEVER REQUIREMENTS YOU HAVE

The cost-effective solution to \$1,495* your computer needs for only

For just £1,495 the Galaxy 2 provides the basic requirements for a small business system:

- Central Processor Unit with 64K of RAM
- Twin disk drives (400K storage per drive)
- Keyboard and 12" monitor

But unlike many other small-business systems the Galaxy System is specially designed for expansion and flexibility to meet changing requirements. It uses the world's best selling micro processor, the Z80A, and is based on industry-standard 80-Bus boards. The business system uses only 3 boards in the 5 spaces available, so extra cards can be "plugged-in" to expand the system; for example to expand the memory, or to give a colour facility, or to develop the Galaxy for the particular requirements of education, research, software development etc.

It has a CP/M operating system which gives access to the largest range of software available for any machine. In particular, Gemini can offer QUIBS; a small-business package developed especially for the Galaxy.

The Galaxy has industry-standard interfaces (parallel and serial), and Gemini Microcomputers can supply a full range of compatible hardware including a Winchester sub-system and printer.

The Galaxy offers the most cost-effective way of obtaining a basic unit which is capable of developing to meet your particular requirements; now

Features include:

- Twin Z80 Processors
- 64K Dynamic RAM
- 800K Disc Based Storage
- 80 x 25 Screen Format
- **Dual Printer Interfaces**
- Modular Design
- Extra Disc Drives Easily Added
- Winchester Expansion Available
- Net Working System Available
- Additional Slots for 2 Cards
- 12" Green or Amber Monitor

*Price is exclusive of VAT

SPEAK TOUS AND WE'LL SOON HAVE YOU NG TO A NEWA

The above are just a selection of the many helpful Apple dealers around the country.

Most offer training courses as well as a complete back-up service, and many will lease you an Apple for as little

Remember, whatever you do you'll do it better with Apple. And with a dealer network like ours it's easy and convenient to get started.

Everybody should have a friend like Apple. Tapple

DUPLEX

SUSS BOX

The DUPLEX SUSS-BOX and DUPLEX SUSS-ADAPTOR have been designed to enable the less skilled computer user to have a better understanding of the correct working connection between a computer and a peripheral, such as a printer. This is achieved by using the commonly used signals (wires) of the RS232C serial data cable specification, a matrix-block and special connector pins.

By inserting the connector pins into the SUSS-BOX's matrix-block at the axis of two incoming signals the user can quickly establish a firm connection. The signals are routed into the SUSS-BOX by two 25 way D type connectors; 1 x female. 1 x male. The SUSS-BOX also provides a lamp for each signal to show its condition when connected in-line, ie High or Low.

JUMPERING:

Jumpering between two or more signals is possible by using three SEPARATE jumpering lines also available on the SUSS-BOX & ADAPTOR matrix-blocks, thus each of the incoming 25 way connectors can be jumpered independently.

WIRES ROUTED THROUGH THE MATRIX-BLOCK:

On each connector, pins: 2, 3, 4, 5, 6, 8 & 20. All remaining pins are wired through.

Lines for jumpering:—J1, JA2, JA3, & JB1, JB2, JB3. All separate lines.

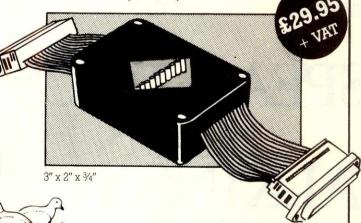

SUSS BOOK

If the user specifically wishes to connect a microcomputer to the OCTET or HERMIT typewriter/printers then refer to DUPLEX's SUSS-BOOK for details on various microcomputer cable 'Pin-outs'.

SUSS-ADAPTOR

Pocket size

When the user has achieved the correct 'Pin-out' between a micro computer and a printer the DUPLEX SUSS-ADAPTOR should be used as a permanent means of connection. This is done by 'transposing' the correct matrix-block pin-layout already established with the SUSS-BOX onto the matrix-block of the SUSS-ADAPTOR, and then installing the SUSS-ADAPTOR in between the computer and printer.

All prices are based on cash-with-order terms

SPEAK TO US AND WE'LL SOON HAVE YOU TALKING TO A NEW APPLE

The above are just a selection of the many helpful Apple dealers around the country.

Most offer training courses as well as a complete back-up service, and many will lease you an Apple for as little as £70 a month.

Remember, whatever you do you'll do it better with Apple. And with a dealer network like ours it's easy and convenient to get started.

Everybody should have a friend like Apple.

Apple is a trademark of Apple Computer Inc., USA.

You were impressed by the unique portable Epson Computer that fits into your briefcase.

Now take a look at the one that sits on your desk.

The QX-10. A fully integrated Desktop Microcomputer System. A new member of the Epson family.

But there's more to the functional and stylish lines of this remarkable machine (just to prove that beauty isn't only skin deep).

The lightweight CPU, monitor and Keyboard units are very easy to use - even for a first time operator. You could say that our system takes all the hard work out of using software, and once used...you probably will.

What's more, when it comes to cost you'll find there's more power for your money.

Just look at these qualities.

192k upgradable to 256k RAM, Z80A CPU, RS-232C and parallel interfaces. CP/M and multifont BASIC comes as standard.

The QX-10 offers an incredible graphics capability. The 80 columns x 25 line display has 640 x 400 resolution and full bit image control for greater definition, 16:1 zoom and special effects.

THE HUMAN COMPATIBLE Extraordinary product.

Exceptional quality.

Not to mention a unique split screen facility enabling different typestyles and graphics to be shown together. A major first for educational applications.

For even more power - simply slot in up to 5 optional interface cards for cassette, bar code reader, joysticks, sound generator, plus a Universal Interface card for developing your own interfaces. Clock, calendar and full battery back-up complete the system.

As with all the other respected Epson products, you are assured of high quality. (We even manufacture the slim line disc drives

So, at last there's a desktop microcomputer system that really works together. To really work for you.

See it soon. We know you'll be impressed.

Address

COMPSOFT'S DMS – winner of the 1982 RICA Awards, 'Software Product of the Year'.

Now Compsoft announce Delta – the very powerful, very friendly database* that the world has been waiting for.

* For micro computers with CP/M, MP/M or MSDOS operating systems. Including IBM PC.

Compsoft Training Centre

If part of your microcomputer's job is to store information, you need Compsoft's software.

Compsoft DMS is already Britains No. 1 record keeping program. And with 4000 users to our credit, we can honestly say we know more about information storage & retrieval than anyone else. We listen to your comments & requests and now we've produced a world first – the Delta – a true transactional database.

If you'd like to know more, we have general brochures, full technical specifications & free

guides to DMS handling a multitude of business situations from order processing, invoicing & stock recording, through to library, personnel & hospital record management.

Find out more about the database revolution. Either telephone the office or clip the coupon

Compsofts Delta – taking microcomputers into the third dimension.

SIG/NET-OFFERING DEALERS A GREAT DEAL

If you are an experienced dealer in the South-East looking for the right micro to handle, you will find it with Sig/net.

At DPLC, the South-East distributor for Sig/net, we feel that we offer dealers the perfect package: a micro system with limitless potential, at a very competitive price with generous dealer discounts and margins, combined with full hardware and marketing support. In return we expect our dealers to be skilled in the installation of packages — either for specific vertical markets or general business applications.

Sig/net 2 is a modular system, housed in a compact unit, to which a wide range of peripherals can be attached. A system may start with a single workstation with floppy disc and be expanded to a multi-user system with virtually no restriction to the number of workstations and hard disc capacity. There are already more than 1,000 users in the UK.

Because the Sig/net operating system is CP/M compatible, it enables you to provide bespoke software easily, in addition to the very wide range of proven business software already available on CP/M.

the collaboration of the colla

The successful British manufacturer, Shelton Instruments, is undertaking a programme of advertising, PR and exhibitions. Enquiries generated in the South-East from these promotional activities are passed on to the dealers, through DPLC. Comprehensive product brochures are also available.

To complement the Sig/net, we offer a range of terminals and printers. And there are appointed national and local organisations to provide after-sales maintenance to your customers.

To find out more details about a Sig/net dealership, fill in the coupon and return it to: DPLC Limited, 8A Walpole Street, London SW3 4QP. Telephone: 01-730 2890.

The HR1

Bi-directional – 17 CPS – some features as below, but without keyboard and lift off facility.

CROWN RANIER - The leader of all interfaced daisy wheel printer/typewriters: Here's why:

The unbeatable Crown Ranier is the only heavy duty daisy wheel printer/typewriter which runs on a linear motor — no belts or cables to break, stretch or wear — and uses the IBM ribbon and lift off correctors. The reliability has become legend in these days of expensive electronic typewriter breakdowns.

CENTRONIC – IEEE – RS232 INTERFACES – No external boxes – interchangeable daisywheels – variable pitch – three free daisy wheels – automatic whole line correction – easily copes with standard printed forms – 195,000 characters per ribbon (at least twice the average character length) – standard lift off correctors – a printer/typewriter at the flick of a switch.

Perfection as a typewriter (now used by local authorities and multi-nationals), perfection as a printer

Beware of lightweight, low cost machines – these can never give long term reliable service. THIS MACHINE WILL!! The professional machine.

Ask you local computer or office equipment dealer for further information. EX STOCK DELIVERY

SINCLAIR OWNERS READ THIS FROM by heard about MACHINE CODED PROGRAMS and to

You've probably heard about MACHINE CODED PROGRAMS and thought "so what! How can they help me?"
Well now you can find out and taste the very real difference by purchasing our latest MACHINE COD programs. These emulate features of the most modern professional computers [12 years writing machine coded programs for IBM, ICL, UNIV/AC and Sinclair means we know what we're talking about].

Just read the specification and you'll see what we mean.

MACHINE CODE TEST TOOL

Test and debug program, we wrote this to help us write our own programs.

TEST and display machine code instructions as they're written.

IDEAL for both the novice and the expert.

FULLY documented with a 32 page tutorial

HEX.IDECIMAL conversion as standard.

CHARACTER CENIERATOR — of unbelievable quality

Supplied free with the Spectrum version.

Available for the 16K ZX81 and 16/48K Spectru

SPECTRUM CHESS Dare you face The Turk

The original Turk was an eighteenth century automaton, a life-size mechanical figure resplendent in Turkish costume and seated behind a wooden cabinet on which a chess board and pieces were placed. OCP now offer you the twentieth century equivalent of that Turk — a chess-playing computer program. The Turk challenges you to a game of chess!

- MANY OPTIONS INCLUDE:

 6 LEVELS OF DIFFICULTY
 DEMONSTRATION MODE
 BOARD EDITOR
 GAMES PRINTOUT FACILITY
 BUITZ CHESS AGAINST THE CLOCK
 TWO PLAYER MODE
 UNFINISHED GAMES CAN BE STORED
 RECOMMENDED MOVE

ADDRESS MANAGER....
Works on the 16K and 48K Spectrum, in 48K it will store, file, select and retrieve over 400 full addresses 1500 individual names); Dynamic Memory Management and compression techniques makes all this po

nd there is a lox more:

FULL SCREEN INPUT and EDITING — see it as a page as it happens with insert, delete and TAB

Commands.

MULTIPLE INDEXING — 3 way user-defined index enables you to define, catalogue, select and print
entries as needed, [essential for the more sophisticated applications,]
INSTANT RESPONSE — yes, this program is very very fast.

SUPER FRIENDLY — crash-proof, extremely easy to use and efficient in a way that BASIC can never be.

**MANY USES

** AT HOME — (storing addresses, printing out Xmas Card lists etc.)

**AT WORK — for mail-order work, internal telephone directory, sorting customers into types, areas, size

... you choose.

**CLUBS — print-out members list, sort different categories etc.

MACHINE CODE...IT MAKES ALL THE DIFFERENCE..... Post order to: Oxford Computer Publishing Ltd., P.O. Box 99, Oxford. Please rush me: Address Manager at 8.8.95 each. | Spectrum only. Chest The Turk at 8.8.95 each. | Spectrum only. Machine Code Test Tool at 89.95 each.

COMPUTERS I Gemini Galaxy 2

"I would place the Galaxy at the top of my list" (Computing Today, April 1983)

- *Twin Z80A Processors
- ★CP/M 2.2 Operating System
- **★64K Dynamic RAM**
- * 800K Disk Capacity
- *80x25 Video Display
- *Serial and parallel printer interfaces
- * Cassette and light pen interfaces
- *User definable function keys
- * Numeric key pad
- * 12" Monitor included

Total support for Gemini & na/com Products

na/com 3 available from MicroValue

Based around the successful Nascom 2 computer, this new system can be built up into a complete disk based system. Supplied built and tested complete with PSU, Nas-Sys 3 and Nas-Gra.

48K System

£549 (£631.35 inc. VAT)

CP/M 2.2 £100

(£115 inc. VAT)

NASCOM 2 KIT £225(£258.75 inc. VAT)

Built & Tested

£285 (£327.75 inc. VAT)

80x25 Video for na/com

Nascom owners can now have a professional 80x25 Video display by using the Gemini G812 Intelligent Video Card with on-board Z80A. This card does not occupy system memory space and provides over 50 user controllable functions including prog character set, fully compatible with Gemini G805 and G815/809 Disk Systems. Software supplied on Gemini system disks. Built and tested.

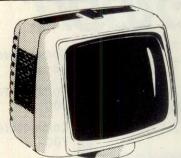

The **Microvector 256A** is a high performance graphics display interface on an 80-BUS and NASBUS compatible card. Various graphic primitives such as vector and character generation are executed in hardware by a Thompson EF9356 Graphic Display Processor. Plotting rates are typically 1 million pixels per second giving full animation capability.
Various vector and character types can be selected. Characters can be scaled to give 256 different sizes. MV 256A Suitable for TV use (PAL-UHF) £199.00 + VAT MV 256B Suitable for TV or RGB monitor £220.00 + VAT

Electronic magnificence from Sharp

Z80A C.P.U. · 48K RAM · 4K ROM · Industry standard Qwerty keyboard with numeric pad · 9" GREEN C.R.T. · 1200 baud cassette · Music and sound · Real time clock · Enhanced BASIC · Full editing facilities · Internal expansion.

Phoenix P12 Monitor

A high quality data display monitor, ideal for all Nascom and Gemini systems. 20MHz resolution. Available in amber or green phosphor.

MicroValue

REAL value — from the Professionals

WHY

Because dirty power is the most likely cause of the unexplained errors and circuit malfunctions which can upset all micro based products and their users.

The Plug with its own built in filter and transient suppressor reduces the effect of electrical noise and spikes and increases the reliability of both hardware and software.

Protect your computer from unnecessary power problems, say 'No' to dirty power.

R.R.P. £15.50 including p.p.

The Plug is available from dealers or direct from the manufacturer

 Clock and calendar with battery back-up

New slimline disc drives

Unique split screen facility

Unique price

£1735 plus VAT

A FULLY INTEGRATED DESKTOP MICROCOMPUTER SYSTEM.

The QX-10. A fully Integrated Desktop Microcomputer system that takes the hard work out of using software. An incredible new member of the Epson family, emphasising cost effective computing on your desk. The QX-10 gives you a lot more for your money.

Lightweight, Z80A CPU, VDU and Keyboard units in modern functional design.

Very easy to use - specially for the first

time operator.

More Power for your money. 192k upgradable to 256k RAM. Incredible graphics capability with zoom facility, RS-232C and parallel interfaces and multi-font BASIC as standard. Compare that with systems costing twice the price.

Add-on power. Simply slot in up to 5 optional interface cards for the following

facilities:-

Cassette Bar code reader

Joysticks Sound generator Omninet

Universal interface card for developing your own

generator interfaces

 $80 \text{ col.} \times 25 \text{ lines screen with full bit}$ image control, 640×400 resolution for greater definition. 16:1 zoom and special effects as well as unique split screen facility allowing different typestyles and graphics to be shown together for educational applications.

TCL SOFTWARE – the software division of Transam, offer complete CP/M software support for the QX-10 and a professional software service to guide you through all the available options.

Combining the resources of Transams experience with CP/M Based systems and software with Epson innovation and reliability means we can offer you your best buy in 1983.

The QX-10 personally packaged by Transam.

THE HUMAN COMPATIBLE MICRO

We also stock the new range of Epson RX and FX printers.

COMMUNICATIONS DEVELOPMENT AND UTILITY PROGRAMS

Perfect Writer re-thinks the whole approach to word processing. All the standard features plus split screen editing on two files or two parts of a single file. Automatic footnotes, indexing, page referencing and paragraph numbering facilities. One set of commands common to all Perfect Software packages and links directly with Perfect Speller, Calc and Filer. Perfect Calc supports up to seven worksheets on line at once and split screen editing. Functions and formulae can be defined by the user. Files can be associated and re-calculated in order of dependancy. Perfect Calc also links with Perfect Filer, to fetch data and to Perfect Writer to create reports. Please contact us for further information.

THE EPSON HX20 PORTABLE COMPUTER £402

+ VAT

As a stand alone portable or linked to your CP/M based computer, the HX-20 takes computing a step further. Unlimited horizons on a limited budget.

Transams portable computer centre offers a wide choice of portable equipment and software. The HX-20 has taken pride of place. Software now available includes:-

CARD INDEX - System/Data Base	£25.00
DIARY - 3 month rolling diary	£25.00
DIY - Do it yourself system generator	£30.00
SALES ORDER ENTRY - For Travelling Reps	£40.00
EPSON CALC- Financial spreadsheet/reports	£30.00
COMMUNICATIONS ROM - ISO Standard	
CORRESPONDENT 20 - Portable Word Processor	
MAILING LIST - and label printing	£30.00
GAMES 1 + 2 - a selection of games, each	£18.00

NEW INTELLIGENT TERMINAL EMULATION AND TEXT EDITOR.

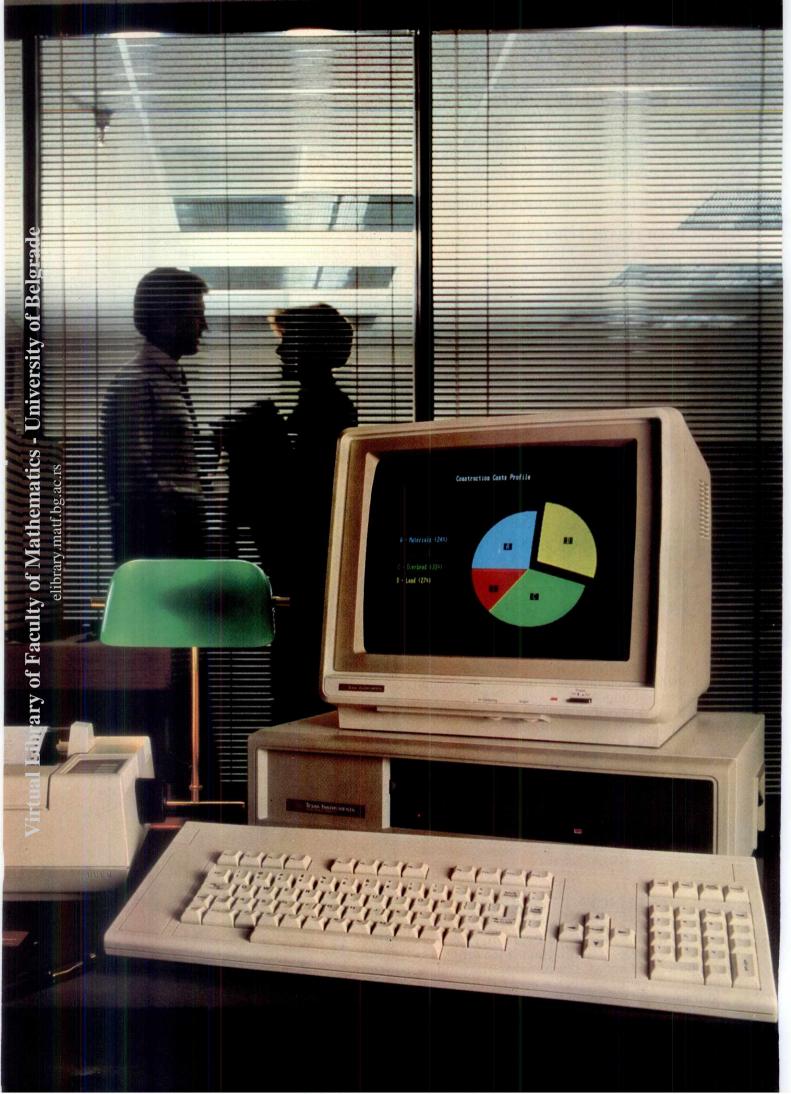

New from Transam, the software (in ROM) allows your HX-20 to interface with any computer and act as a terminal to transmit and receive with 'off line' editing. Full screen editor for text preparation.

Plug in ROM and documentation £45.00 plus VAT. Sendata acoustic coupler £220.00 plus VAT.

A computer small enough to fit into a briefcase yet with a full size typewriter keyboard, LCD virtual screen, printer and microcassette facility actually built in. High speed serial communication with other computers plus the Epson reliability – a world beater.

The new TI Professional Computer. If you want the business edge, it's the answer.

Todav's business manager is faced with a world of questions, often tough. Questions about productivity. Cost control. And the bottom line.

To help you come up with sharper answers and alternatives, to give you the business edge, we introduce the new Texas Instruments Professional Computer. The one with the power, the expandibility, the easiest-to-use keyboard, extremely high resolution graphics, and a broad array of software.

All the leading operating systems and programming languages are available. You can use many

popular application programs from the best software suppliers to help you create spread-sheets, do word processing, construct graphics, communicate with other data bases or create your own.

All of which lets you control assets, manage your time, and make projections for tomorrow's performance - today.

And for a clear "hard copy" printout of information, you can rely on the new 850 Series printers, made by Texas Instruments especially for the new TI Professional Computer.

The TI Professional Computer

helps you make better business decisions based on better information. With the performance and reliability you expect from TI.

In short, it's the answer. For full information phone 0234 223000 or write to Texas Instruments, Manton Lane, Bedford MK41 7PA.

Creating useful products and services for you.

Let PHILIPS put a word in for your business (or thousands of words)

The P2000 word processing system

..... lets even one finger typists turn out secretary-perfect letters. Time after time after time.

And it costs from under

£2000 complete with letter quality printer!

The P2000 system brings word processing power within the reach of practically any small business. Accountants, small contractors, solicitors, sole traders. In fact anyone who needs to put out letters, quotations, invoices, etc. quickly, neatly and accurately.

No more hasty alterations giving your letters that 'amateur' look. No more frantic retyping when you realise you need to make a change just before

last mail collection. You can change text, correct errors, add or delete words or paragraphs, all at the touch of a few keys.

If you want more than one original it's no problem. You can even send the same letter to all your mail list, each individually titled. You'll soon find that the P2000 pays for itself in time saved, not to mention what it does for your business image.

Of course, the P2000 will do more if you want it to. For relatively small extra cost it will handle book-keeping, statistics, record filing and all those other office chores.

And all underwritten by the Philips' reputation for quality and reliability. It's simply for everyone.

TO FIND OUT HOW
PHILIPS CAN PUT A WORD IN FOR
YOUR BUSINESS, CONTACT:

Simply for everyone.

Sound business sense or volume buyers

The Autumn Computer Trade Forum is the UK's largest razmatazz are all designed for profitable business. and most successful trade event and the only show that fully understands the needs of volume buyers.

It offers you a comprehensive display of minis, micros, software and peripherals in an environment that's specially made for volume business.

Who is CTF for?

Distributors. Dealers. Software houses. Systems integrators. Retailers. OEM's. In fact anyone who makes a living buying and selling computers, software and peripherals. So whether you're new to DP/WP or know the business backwards, CTF is the event you mustn't miss.

How can CTF help you sell more?

The exhibitors at the Computer Trade Forum understand your needs. That means they'll be talking your language. Quantity terms. Discounts. Marketing support programmes. Delivery schedules. The whole range of services to help you sell more.

Who will be at CTF?

Texas Instruments. Logica. DEC. Systime. DRG. Zygal. Motorola...and many more! And for every name you know there'll be many you don't-with products that could well be your next year's big seller.

Why CTF is different!

The Computer Trade Forum is the only show that understands what volume buying really means. The atmosphere, the choice of exhibitors, the absence of

CTF has been specifically designed for you and as a proven, established national event it offers you even more with the support of leading UK suppliers.

Post the coupon today

The general public is not invited to CTF. The emphasis is on volume business. And for you it's free! Just fill in the coupon and we'll send you free tickets (worth £3.00 each) by return of post.

If you need to know more, call 01-747 3131.

CID COMPUTER INTERFACE DESIGNS

Apple and IBM PC users,

performance products add magic to your computer

The finest of plug-in performance products for your Apple II and Aple IIE personal computer.

WIZARD-80

80-Column Card

Lets you see exactly what you will get when typing/editing 80column format. Displays upper/lower case. Compatible with CP/M, word processors, modems, software and all current Apple II expansion boards.

WIZARD-16K

16K RAM Memory Card

Expands your memory . . . Adds 16K bytes of RAM. Compatible with Z-80 cards for CP/M. Runs with all Apple languages.

WIZARD-BPO (for Serial & Parallel Printers)

Buffered Printer Output Card

Lets you continue using your Apple while the printer prints. Contains 16K byte "Character Buffer" expandable to 32K bytes full graphics included. £153 (parallel) £183 (serial)

WIZARD-IPI

Smart Printing at a Smart Price

The Wizard Intelligent Printer Interface for parallel printers (complete with cable). It offers not only text printing, but enhanced text formatting such as: line length, left and right margin, page length, software control of automatic line feeds and perforation skips.

Graphics too - hi-res screen drump, alternate hi-res screen dump, 90 degree rotation, inverse video, double-size picture, left margin alignment . . . all done with single-key commands.

For your IBM Personal Computer:

WIZARD-SPOOLER (Both parallel and parallel/serial

versions)

Contains 16K byte character buffer expandable to 64K bytes. Enables you to use your IBM PC while the printer is printing. The parallel/serial version allows you to switch from parallel to serial so that you can run either of two printers from your personal computer. £222 (parallel) £268 (parallel/serial)

WIZARD-MEMORYCARD

Will expand the memory capacity of your IBM PC in 64K increments up to a maximum of 256K bytes. £330 (64K version)

For your EPSON Printer

WIZARD-EBI

Up to 64K of Buffering in your Epson MX Series Printer The Wizard Epson Buffered Interface mounts completely inside any MX Series printer. It provides up to 64K characters of buffering in steps of 8.16, 32 or 64K, and offloads the timeconsuming printing task from the computer to the buffer.

Use your computer for the next task while the printer prints the previous one. The Wizard-EBI, with its on-board 5 volt regulator will never overload the Epson 5 volt supply as others do.

ABOVE PRICES ARE EXCLUSIVE OF UK V.A.T.

UP TO 652K DISK STORAGE ON AN APPLE II!

THE ELITE SERIES OF DISK DRIVES FROM RANA SYSTEMS

More juice on Apple's inferiority.

advanced write protect feature which advariaced write protect learner writer) makes it impossible to lose your information. A simple touch on the front panel's membrane switch gives you failsale control. Apple of course only has a notch or tab, which gives you only minimal protection.

With the superior Elite controller card, you can control up to four floppy disks using only one slot. With Apple's you can only use two Of course, you can still plug into Apple's controller card, but down the line you'll want to switch to Rana's and save vourself a slot

Elite also gives you more

Even our most economical model, the Elite One, gives you 14% more storage than Apples 163K versus Apples 143K. With our Elite Two offering 326K and our top-of-the-line Elite Two offering 3 356% storage increase at 652K. That's almost comparable to the storage of the storage and the storage of the to hard disk performance, all because of our high density single and double sided disks and heads

We put our heads together to give you a superior disk drive.

We designed the Elite Three to give you nea hard disk capacity with all the advantages of a minifloppy system. The double sided head oper-ates on 80 tracks per side, giving you a capacity ates on 80 tracks per side giving you a capacity 652K bytes. If would take 4½ Apples to give you

The Elite Two offers an impressive 326K bytes and 40 tracks on each side. This drive is making a real hit with users who need extra storage, but don't require top-of-the-line capacity.

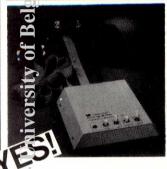

ELITE One	£26
ELITE One & Controller	£34
ELITE Two (2 x 40 Track)	£4"

How much would

you pay to make ur Apple II Plus

In November 1982, PCW pub-lished a bumper round up of all the Benchmark Timings since PCW began. The Olivetti M20 came out top of the 'league' with an average Benchmark timing of 11,5. Running the same Benchmark test programs,

the Apple II Plus with Accelerator II averages a timing of 8.58 — that's an incredible 25% faster than the Olivetti M20.

We have reproduced some of PCW's findings, incorporating Benchmark Timings for the Apple II Plus with Accelerator II.

Machine	BM1	BM2	вмз	BM4	BM5	BM6	ВМ7	BM8	Average
Apple II Plus with							9		
Accelerator II	0.3	2.4	4.5	5.0	5.5	8.2	12.9	2.98	8.6

New Hall Hey Road, Rossendale, Lancs., BB4 6JG

Norwegian Agent: 103-5 Blegborough Road, The Norwegian Software House Address Observation 145 Oslo 5 Oslo 5 Oslo 5

Guy Kewney delivers his monthly package of micronews.

Private Eye

Some time last year, a deal was concluded between a computer maker and a shop, which is now attracting the attention of the police.

It involved the maker setting up a 'front' for mail order purposes, because it didn't want its dealers to know that it was indulging in mail order.

In order not to upset the police, I'll keep the story anonymous. As I am not God, however, I cannot be sure whether people are telling me the truth. I can, therefore, only present the story with the facts that have been made known to me.

First of all, the computer company was in difficulty. It had signed big deals with retail chains, promising to deliver computers (which it had not yet made) too cheaply: that is, at a price which would not have provided it with more than pennies in profit.

The company itself was in debt, and the bank — presented with this deal as evidence of its bright future — had become so alarmed that it began taking steps to wind up the company. So the company, which from now on we will give the name R Souls, began looking for a deal which was obviously much more profitable.

But you can't do that, after having just told a major chain like W H Greenson that you can only supply them with 1000 computers (when they wanted 10,000.) If you do, it will come back and demand that you supply the requested number, and do not divert its products directly into the postbags of customers.

So R Souls decided to disguise the operation. The idea was to set up an associated company which would print the advertising under its own name.

To do this, it needed a handy fool who would set up N D Fule Ltd — a dealer — and advertise his shop and also offer mail order computers and software. Then, if W H Greenson were to complain, R Souls would be able to throw up its little hands in despair, and say: 'It's awful, isn't it, but what can we do?'

The reason that R Souls needed a fool for this was simple. To make its profits, mail order people have to accept machines at a very high price — so if they cost £100, they have to pay £95 (or more). They have to be too dim to see that — as a dealer —he could get them at dealer price — and if R Souls refused to give him a dealer price direct, he could get machines through friendly arrangements with other dealers.

Look at the arithmetic. R Souls pays for the advertising, and prints N D Fule's address. A hundred people write in and pay £100 each, and a mere 15 people walk in through the door, and buy them off the shelf. (That makes 115 computers.)

But N D Fule then rings up R Souls, and plaintively says: 'The response has been awful; I've only sold 20. Oh, and I'll need 95 machines for my shop, at £60.' (That, oddly enough, also makes 115 computers.)

He then flogs the machines to his hundred mail order customers at the high-profit rate, when his shop only had 15 customers through the door. Instead of making 100 times £5 (plus the retail of 15 times £40) he makes a thumping lot more.

This simple dodge doesn't appear to have occurred to the chief of R Souls, nor to the N D Fule man. They signed a deal, which I've seen,

setting all that out in terms obviously designed only to make lawyers rich.

Of course, the deal didn't work. Primarily (I think) it didn't work because the wretched factory at R Souls was not making any machines. That is to say, it was making them by the hundred, all bar one small chip which the chip maker had neglected to inform it was not quite ready — and didn't work. So the computer didn't work.

At this point, R Souls set up a subsidiary, which we will call Flybynight Systems, and gave this new company the rights to make the Soul computer. Then it raised enormous City finance, and told N D Fule that his contract was no longer valid because he hadn't stuck by the contract. And anyway, his contract wasn't with Flybynight, was it?

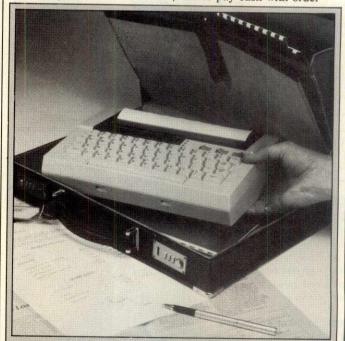

The way in which he had broken his contract is interesting.

He had been told to put all mail order money in a special 'escrow' account in R Souls' bank, and to send out products direct to mail order buyers.

But the bank, (I think, quite reasonably) felt — since it was just about to wind up the company for its indebtedness — opening a new account was just not on. So N D Fule couldn't pay it into its joint account so, obviously he was breaking the contract.

At that point, fiction has obviously entered the scene. It gets worse from here on.

According to R Souls, there had never been a mail order deal. That is, it was revoked before it was signed. It continued to pay for N D Fule's advertising, and check the artwork for the advertisements, but there was nothing R Souls could do about the fact that he was offering mail order. He was a dealer after all — except he had to pay cash with order

Unlike most portable micros you may meet, this Texas model 709 has a full width printer. Unlike most computers, however, this model 709 has no data processing power. Eventually, says Texas Instruments, it is proposed to provide 'solid state software' (that is, plug-in cartridges) to make it do some of the things that a computer could do — such as automatically dial up a computer and provide the user's log-on sequence. At £800, I should jolly well hope so, too.

For people who don't like reaching behind their computers to unplug the printer before connecting the modem, or putting the daisy-wheel on, or whatever, the T-switch (T for Transfer) from Inmac costs £135 for a two device switch, £175 for four, or £215 for six devices. Other configurations to suit every taste: details on Runcorn (09285) 64321.

because he wasn't creditworthy.

He swears he sent the £9700 he received to R Souls (as Flybynight strangely renamed itself). It says he sent no money, but did pay cash for his retail sales. He denies this — claiming his deal said he didn't have to pay in advance of getting machines. He sent the mail order cash. He couldn't send the retail cash, because he was going bust. It says he wasn't entitled to machines in advance, because there had never been any deal. And it says that it will lose £20,000 because of it, refunding customers their money or supplying machines and software.

At the end of the day, one good thing has emerged: one customer, brighter than the rest, refused to accept R Souls' assurances that N D Fule was not its agent, and threatened to sue them jointly — and was given his product ('without prejudice'). Shortly after, out of the goodness of its heart, R Souls decided to supply the machines and software to anybody who could prove they had sent money to N D Fule.

Fortunately, I don't have to make up my mind whether any of the three bumbling twits involved was actually a crook.

But the law says that you can't take money for goods you can't supply, whether you do it on purpose, or by accident. And so at least one man out of three bumbling

remand' waiting to be tried for fraud, and possibly a few years serving a sentence. Somehow, that spoils the joke.

I wish the police joy of it.

For any customers of mail

For any customers of mail order computer firms who have had similar experiences, the lesson is simple; it isn't: Don't buy mail order - because most people who do have no other choice. It is: Do not accept the assurances from supplier and dealer that 'you have to sue the other one'. Threaten to sue them jointly; this will magically change the supplier's attitude from 'get lost, sucker,' to 'you poor, poor dear, you really deserve a machine to console you, and here is one, out of the goodness of our hearts.'

Make sure you get the full warranty, in writing.

Brainy deal

The Newbrain portable micro is about to change the meaning of the word 'cheap' on systems using CP/M as the operating system.

By August, the plan is to supply a Newbrain with CP/M, with a single 200 kbyte floppy disk, display monitor and printer for £700 or less. The printer will probably be the cheap Oki model.

This package will be upgradable to a 96 kbyte system with twin floppy disks of 800 kbyte each, plus monitor and printer, for £1200.

Grundy has signed a software contract with Peachtree:
Peachtree has implemented virtually the entire product range on the Newbrain.

That will be marketed along with the Newbrain CP/M system — the extra 64 kbyte expansion module.

Anybody needing a CP/M system this month should ignore this announcement — because you won't be able to get one for a little while.

Production has already begun, but order backlogs and other prior bulk commitments will take a fairly sizeable chunk of time. Expect to see computers in high street stores in August.

Grundy has also done an interesting deal on maintenance: it has signed a contract with the Thorn EMI subsidiary, Software Science.

This means that the dealers and Grundy will act as brokers for the Software Science maintenance facilities on a nationwide basis — there are ten branches around the country. This deal will not just cover the Newbrain itself, but expansion modules and peripherals, too.

At first, the new expansion system is expected to be clumsy-looking. As an interim measure, Newbrain will provide a metal case racking unit with built-in, heavy duty

power supply (able to drive the whole lot). Eventually the company will design and develop a packaged unit for desk-top work. The Newbrain itself can always be unplugged from the system, and carried home.

Details from dealers.

Going cheap

Scanty details of the Advance 86 — to be launched shortly by Dixons — indicate a frightening change in the price structure of 16-bit micros.

For £400, including VAT, this machine (without disks) will provide an 8086 processor (that is, the proper 16-bit chip of which the 8088 in the Sirius and IBM machines is the little brother), plus 128 kbytes of internal memory.

Owing to the 8086, it runs at around 40 per cent faster than the IBM micro, but the builders say it will be almost totally compatible.

The system will apparently have colour display, the MS-DOS operating system, an IBM standard tape cassette interface, and a detachable keyboard.

I'm told it will take IBM personal computer cards, including the standard £200 IBM disk controller card. And

Sending data down a phone line to a computer involves rather more than the modem to connect your own processor to the phone: there is the small matter of persuading the receiving computer that what is coming down makes sense.

Specialist in computer communications, Albetros, has produced a package called Semaphore, which takes into account all the file handling eccentricities of either computer.

That is, as long as the computers fall into the categories for which it has a list of eccentricities: namely any CP/M or CP/M-86 system; or any MS-DOS computer; or Digital Equipment's minis; Data General's Eclipses; or Prime and IBM minis and mainframes.

Cost of the software on diskette starts at £125. Details on

when the computer is fitted with diskette drives, they will read IBM PC-DOS diskettes.

The price of a complete system isn't easy to work out from that information, so I've been told to quote a price of £1425 for a complete system with one five megabyte hard disk, one 329 kbytes floppy drive, and the operating software.

Bill Gates, head of
Microsoft, says that his big
test of whether a computer is
compatible with IBM's
personal computer is: 'Will it
run Flight Simulator?' (a game
which displays an immensely
complex screen of aircraft
controls and outside scenery)
— and further says that the
Advance 86 will, indeed, do
so. He has been working
closely with the designers,
getting MS-DOS running
properly.

At this stage of the project, details like 'How many are going to be made?' and 'When will they be available in Dixons shops?' are unanswerable. But the news is obviously worth passing on to your own dealer next time he tries to sell you an ordinary American eight-bit system with ordinary CP/M for around £2009.

Anyone going down?

You will have noticed that the price of ZX81s, Commodore VICs, Texas Instruments 99/4As and ZX Spectrums are all down.

The ZX81 has come down to £40, the Spectrum to £100 (£130 for the bigger version with 48 kbytes of memory); the VIC 20 is approx £85, and the Texas machine £100 — without the trimmings.

It's interesting to try to work out why; but before looking at that, there is something else that is even more interesting. That is: spot the odd ones out.

The obvious one, the BBC Micro, hardly need explaining. Acorn can sell every BBC Micro it can build, and Acorn's dealers are frantic to get hold of add-ons like games, joysticks, disk interfaces, second processors, or just anything at all. And when the Electron starts

will not get any easier with the BBC Micro, because there are enormous differences, and because nobody who can afford the one will be satisfied with the other.

It isn't the Dragon, either. That and the Lynx both sell in the £200 price range, and all the price-drop machines are well below that level.

No, the interesting omission is the Commodore 64.

The 64 still costs £300 in this country. Astonishingly, it costs around \$300 in America.

Once, there was a tradition that gave us lots of prices like this in the UK, but these days an imbalance as big as all that cannot last. It is a warning that it will soon change.

As things stand today, the 64 looks (on paper at least) like a computer roughly equivalent to the BBC Micro. It is £100 cheaper, but needs a special tape recorder, and has a noticeably inferior Basic which can be upgraded to something at least comparable by plugging in a special purpose cartridge.

This cartridge, Simons
Basic, is spoken of very highly
inside Commodore, but less so
by programmers with whom I
have discussed it. A matter of
taste, perhaps, but in any
event, not a clear advantage
over the BBC Micro, and
nothing like the publicity that
the BBC can generate to back
it, while it does make the two
prices very similar.

So, expect Commodore to cut the price of the 64. When, I wouldn't like to say. Probably around August, and possibly not by a straight price cut — something more like the VIC move.

The VIC's price cut has been engineered by supplying the special tape recorder, the 'Teach Yourself Basic' programming course, and four games, all for £140.

On the 64, anything could happen for a package deal. It might be software and tape, it might be a special disk, or it might even be a colour monitor thrown in free. Whatever it is, the effective price of a 64 will be down to

£200 long before Christmas. Now: as to why the prices fell, the answer is easy. They were too high.

The VIC has been selling for a lot less in America than the LIK for months. So has

For those of you who felt ignorant and uninformed when I referred to CP/M hard disk systems for £4000 that didn't have printer or software, gaze enraptured at the Cifer Cub. It is a 'low-cost winchester-equipped micro priced at only £3395', with five megabytes.

You don't even get CP/M Plus: just a nice, ordinary version 2.2. Details on (0225) 706361.

Commodore had planned to sell 10,000 VICs per month, and the only reason the actual figure was 7000 was that the factory in Germany couldn't make them that fast, and so there wasn't any point in reducing the price, except to eat into the Spectrum market — and since Sinclair couldn't make enough Spectrums either, nobody cut any prices.

But the high UK computer prices made Japanese and American inventors look greedily at the market here. The Humdinger was just the first of many machines prepared for export to Europe; others wil appear over the next few months — Panavision, Mattel Aquarius, Sord M5, and so on.

So Sinclair boss Nigel
Searle was persuaded to lower
the Spectrum price to
discourage the importers, and
VIC and Texas had to keep in
step.

Then, the unforeseen factor arose, W H Smith, with 20,000 black ZX81s in its warehouse (so people say) did a little arithmetic. A Spectrum with 16 kbytes costs £99. But a ZX81 with an add-on 16k costs £80.

Panic. Cut the price of the ZX81 by £10.

Smith's own version of the story is that they decided to lower the price a week earlier than Sinclair 'so that customers could benefit over the May Day bank holiday'—an idea which struck me as

go up *after* the holiday, not before, as any Christmas student knows.

Behind the times

British micro builder Casu after years of near invisibility to the average UK buyer — except those inside British Telecom (who bought most of the production) — has stepped into stage centre with the daring innovation of a five-inch diskette.

Anybody who wants to explain the company's stategy, please do so.

At a time when IBM is selling a system worth £2300 for over £3000, Casu has released a system with the same chip, same operating systems, a bit more memory (and a lot more disk) for £4000 including printer.

At a time when everybody else is starting to decide which three-inch diameter diskette to use, Casu is stubbornly sticking to the eight-inch diameter standard — it has announced upgrades for all its old Z80, MP/M micros, now also available with winchester disks of 20 or 40 megabytes.

It must leave Apple, Osborne and Sirius absolutely quaking in their boots at what we clever UK computer people are going to do next. Why, Casu has sold nearly

year, IBM will be making a mere 12,000 PCs per week.

I wouldn't mind, really I wouldn't, even with the bee I have in my bonnet about wanting to see a strong British computer industry, if the people who do this sort of thing (and that includes 'quality' micro builders like Pericom, Sintrom and Rair) weren't so obviously pleased with the wizardry of their growth.

Casu sent me 28 pages of information on these poorman's minicomputers, ending up with a three page soliloquy on the subject of their 'planned growth' from a garage in 1976, with a turnover rising to £5m last year.

In the motorbike industry, this would be phenomenal. In the computer business, comparison with another micro company that was in a garage in 1976 shows just what an opportunity we are all missing.

Just in case you didn't know from the financial press, Apple is in the Fortune 500 the list of the 500 biggest US companies, as compiled by the magazine Fortune, each year.

It's all right for you. You don't have to go to press conferences while important executives from ICL harangue you about how IBM has got it all wrong by failing to design a multi-user micro, and how Apple has taken a very silly risk by trying to launch Lisa. I do.

Tardy Tandy

Were it not for one little detail, I would have been planning to spend \$800 as soon as I reached America for the National Computer Conference (that was at the beginning of May, in Los Angeles) on a Tandy model M100.

The M100 is a portable computer which knocks spots off the Epson HX-20. It has a similarly nice, typewriter style keyboard, is very much the same size, and weighs around the same.

But the Tandy machine
(built by Japanese firm
Kyocera) has a display which
is almost twice the size of the
Epson. And it has text processing software by Microsoft,

Multi Tool word processor (silly name isn't it? Nobody explained British slang to them, you see).

The \$800 system gives only 8 kbytes of memory: up to 32 kbytes can be added.

The drawback is actually one of its biggest advantages: a built-in modem. In America, this allows the computer to be plugged into a phone, to transmit text to any other computer with a standard 300 bits per second 'answer' modem. In Britain, it is so much useless silicon, because our CCITT standard modems can't understand a note that American Bell standard modems can whistle.

This idiotic lack of common standards mean that I'll just have to wait until the UK half of Tandy gets its act together with the British Telecom people, and develops, then gets approved, a UK type modem.

The processor inside this marvel is a special CMOS silicon which uses almost no power at all — but which behaves like an Intel 8085, which is a CP/M family processor. Unlike most portable computers, however, this one also has CMOS process in its memory and other chips. So it really can do a lot of work from four pen cell batteries.

And where things like Osborne, Kaypro, Compaq and so on will fit under most airline seats (but not the window seats, nor the aisle seats of DC9 type aricraft, because I've tried), this one will sit on your lap, and let you get on with your work.

I wish I thought Tandy UK would have it out before Christmas.

Expensive claims

A computer called the Kaypro II, designed to be an 'improved' version of the portable Osborne 1 but to sell for the same price, has been launched in the UK by a new company called CK Computers.

Unfortunately, the new company has neglected to take the important step of making the price in the UK the same as Osborne's UK price.

The man behind the deal is

previously famous in the business because he set up DRG as a rival to ACT, importing the Victor (which is the Sirius 1 in a different colour box) as a rival to the Sirius.

He is repeating a claim I've heard a lot in America, to the effect that the Kaypro (because it has a bigger display screen than the five-inch Osborne scren) is outselling the Osborne.

Like the Osborne, the Kaypro II is a good, standard CP/M workhorse, and I might leave it there, if the 'outsell' claim hadn't been made several times, quite publicly.

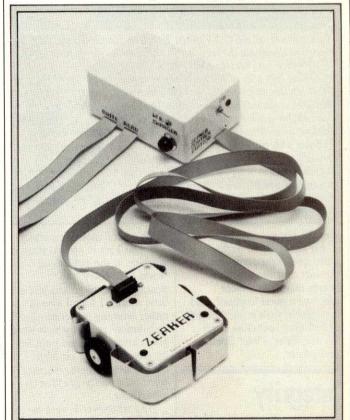

I may be biased by my fondness for the Osborne, but there are several reasons why I find this particular claim unconvincing.

First, the maker of the Kaypro II, a company called Non-Linear Systems, is known to have been looking for a buyer for its computer business, which is something of a sideline.

Second, a very big dealer in Los Angeles, Jade, assures me that it is doing a great deal of Kaypro business, but not more than Osborne business — despite the fact (it says) that it knows more about fixing the machine than Non-Linear Systems does.

In the words of one senior Jade executive at the recent West Coast Faire: 'The machine was designed by an outside circuit design consultant, and Non-Linear Systems has a very rudimentary idea of what can go wrong with it.'

Third, the machine carries the same Microsoft MBasic interpreter as the Osborne. According to Microsoft head, Bill Gates, information available to him doesn't appear to support the Kaypro II claim. I presume it pays

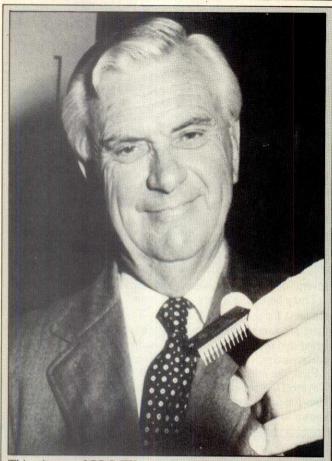

The Logo turtle, made famous by a television programme on Seymour Papert (the South African inventor of the language Logo) is a bit on the costly side for many children. And children are the prime targets of Logo as a teaching language.

Colne Roberts has released this Zeaker Micro-Turtle, at £52 (plus VAT) for the kit, or £69.50 (plus VAT) ready-built. Any computer with a bi-directional, eight-bit port (often called 'parallel') can drive it, as can the Spectrum or ZX81 (for which Colne has special interfaces).

Under it is a retractable pen; its two wheels are separately controllable, and software supplied with it will enable it to learn its way around an area, dodging obstacles. But you don't get Logo with it.

Details on 01-892 8197.

This picture of BBC TV man Kenneth Kendall was sent by Acorn to illustrate the fact that it has used his voice as the basis of its voice synthesiser chip.

This is very silly of it. Everybody who saw the BBC programme in which this chip spoke for the first time will recall that it sounded like a damaged recording of a four-foot jews-harp being buzzed by a timbermill bark-stripper, through a helicoptermounted carbon microphone, down a faulty telephone line.

Even the programme presenter, Mike McNaught Davis. proudly and triumphantly asked by his assistant to guess whose voice it was, could not be persuaded to agree that it sounded human, never mind like Kenneth Kendall. Maybe it was meant to be his voice after getting the illustrated chip stuck in his throat.

him the correct royalties.

All of which is, perhaps, quite irrelevant compared to the fact that the machine seems nice, has a clear display, a good keybord, and is portable with a good bundle of software including Perfect Writer, Filer, Calc, Speller and others.

Integrity

Long ago, when I was a little lad, and wanted my mother to buy a book which we couldn't afford, she took me to the local public library and suggested I borrow the thing for as long as it took to read.

My puritan nature was revolted. If everybody could get books from libraries without paying, what would happen to the book shops? And without bookshops, what would happen to books? Was the magic world of reading going to collapse overnight?

When I grew up and started working in the publishing world (I'm sorry, the nostalgia has to go on, just a little more), I found myself either working for 'controlled circulation' papers which were given away free, and paid for by advertising, or on high quality newspapers, which were only partly paid for by advertising.

And whenever I went to interview a software producer, he would always have ready for me a file of useful information about his company, including Xerox copies of press reports. On his desk would be a single copy of at least one newspaper like Electronics Weekly or Microscope or The Economist, and attached to that newspaper would be a piece of paper with ten or twenty names on it. People who had read it would cross

their names off, and pass it on.

Some of these software producers sell complex programs, like database managers. Some of them are good, some of them are too clever for me, and some of them are useless to man or beast — though there is no way of finding this out until you've used them for a week or two, filled them with information, and found that it won't come out again.

One such producer of software, a very good friend indeed, recently accused a local bunch of children of 'stealing' software because the five of them clubbed their pocket money together to buy a program they couldn't otherwise afford.

This man is perfectly rational. He would never dream of trying to close down public libraries in order to boost authors' fees, nor would he imagine that closing down libraries would have any such effect. Yet he is firmly convinced that if he can only find a way to make software uncopyable, everybody who 'steals' software will instantly go into the nearest shop and buy the programs they have borrowed.

His latest idea is to make sure that every computer has a serial number, and that software sold to me will only run on my computer. This would prevent me from lending it to my friends.

Quite apart from the problem of what happens

when (in two years' time) we are all on local networks getting our software from the central disk, and linking our networks (in five years' time) to each other via 64000 bits per second data lines, I can think of only one program that would have been sold in large numbers if only one person could use it, and that is VisiCalc.

And all the best-selling programs I know are completely copyable. Yes, there are three copies in existence for every one sold, but there are three times as many sold as the rival program can claim.

There is a lesson to be learned there. It has to do with 'pigs in pokes' and it has to do with advertising by word of mouth. But you need not expect to see the lesson learned by most software producers — they are too close to the problem.

My good friend was once reduced to an almost frothing rage by my careless mention of the fact that one of his programs could be easily duplicated by following the instructions in his manual. I didn't even repeat the instructions.

I have even sold copies of his program by lending it to friends (copies, of course) to try out. He actually tells a lovely story of a programmer who wanted him to publish a program and insisted on having a binding contract that it would be published before

The reason the word 'easy' is displayed in two-inch high letters is that the operator is partly blind. The ViewScan system uses the Epson micro and a little camera to expand the word from paper, or from the computer.

It isn't a giveaway but there is a special £500 discount to mark the launch of the computer based system.

Details on (0602) 814673.

Looking like a glass elbow over a map, the Versawriter connects to the IBM micro as a way of feeding drawings into the computer memory. It costs £200, and is available from Pete & Pam on (0706) 212321.

even saying what sort of program it was. He actually gives away a very useful version of one of his programs, in the hope that you may like it enough to come back and buy the full version.

But talk about software libraries, and you will have to survive without his excellent companionship for weeks.

In general, I have learned that you should not expect sense from a smoker about health, or logic from the IBA about contraception, or a warm welcome from Digital Equipment if you're a friend of mine.

It is a year since exsoftware publisher Julian Allason told an excited world that tape duplicating 'has destroyed the computer games software business' rather than admit that his Petsoft programs were all out of date — and yet games software writers, even of totally copyable Spectrum tapes, are earning £35,000 at the age of 17 and getting invited to dinner with Margaret Thatcher.

These are facts.
But don't discuss them with software publishers. They won't understand.

Fruitful promises

The UK importer of the

The announcement came in the course of a financial deal which raised £6 million to pay for the development of the computer. It will be called the Apricot, will be broadly compatible with the IBM Personal Computer — but portable and more powerful — and is promised for this year.

Actually, the question of when it will be available is a matter of guesswork. In May, ACT executives admitted that they didn't yet know of working prototypes, but still said they would let software houses start work on 'preproduction models'. That began in June.

I don't doubt their sincerity, but I do doubt their judgement. I've seen more experienced hardware designers than ACT take more than a year from where they are now to the point where people could walk into shops and buy computers.

Look for your first Apricots in January.

Narcissistic tendencies

It is an old rule that when people tell you how amazingly cheap a system is, but don't actually quote a price, you can be sure it isn't cheap.

In the case of the Dutch Tulip micro, a beautiful yellow-coloured IBM-like system with the more powerful

have to match up to this:
'For it is Compudata which
has developed the Fourth
Generation Microcomputer,
going by the striking name of
Tulip System I. Its
introduction worldwide was
carefully prepared to ensure
maximum impact: with the
advent of the Tulip System I,
the fastest genuine 16-bit
microcomputer is a fact.'

After that low-key, modest introduction, the style of the announcement warms up a bit, mentioning a 'truly unparalleled combination of advanced technological features', and climaxing triumphantly with 'The know-how that Compudata has gathered, and which many companies view with awe, constitutes the basis on which the future of Compudata, its dealers, and the European micro electronic industry will be built.

The technical data sheet, which accompanied this awesome megalith of technological buzz-wordery, went on to detail a perfectly ordinary micro running perfectly ordinary programs like WordStar, SpellStar, dBase II, Multiplan and MailMerge (all optional).

Anyone who is interested, says Compudata, can obtain more information from them on 073-422045. I'm fairly sure I didn't get this one on April 1st.

The knowledge

Spend five minutes trying to explain local area networks to a taxi driver one day, and you will learn two things.

One, you cannot explain them to anybody who doesn't know what computers, disks, storage, printers, files, displays and data rates are already. And two, what you are trying to do is actually easier than installing one.

The news that American firm 3Com has successfully persuaded 25 retail stores to stock its line of EtherSeries add-ons for the IBM PC, shows what a lot that company has achieved in its short life.

It is easy enough to persuade a manager, who has ten colleagues, all wanting a three megabyte hard disk at around £800 each, that he really wants one 80 megabyte drive at £2500 and a few network connections. It is

This happy family photograph shows Epson distributors. The man to look out for is called Carl Tayfour, head of Informex — one of 11 Epson distributors dropped just before this meeting. (He isn't in the picture).

Epson's larger-than-life sales manager, John Patterson, explained the dropping of the eleven with the tactful comment: 'Let's be honest, we want distributors who are going to commit to us in the long term, and not just make a fast buck at someone else's expense.'

Epson subsequently let it be known it was taking legal action to get £100,000 which, it claims, Informex owes them.

I think Tayfour may have taken this somewhat to heart. He was last seen talking to lawyers about £500,000 he reckons Epson owes his company. 'We were one of its' biggest distributors. We made it what it is today in the UK,' he told the trade paper Microscope recently.

You see: now that the hardware side of this business is getting

quite another to get him to buy the network.

The 3Com trick is a little box, with an IBM PC plug-in card, and a length of coax cable — TV cable by appearances. In the box are full instructions — the card costs £700 or so — and you can do it yourself.

Just in case the prices look a little too close, they also have a lovely range of networked software. There is Ethermail, where all the users in the artwork club can swap memos instantly, and there is a networking game, Etherman (no, nothing like Pac-man) and lots of other useful and envy-producing things.

Details on (415) 961 9602.

Autocode

Programmers who find it easy to write programs with dBase II or Cobol will probably dismiss Autocode as the sort of thing for weaklings who are afraid of cold baths.

It does most of the hard work of converting untrained ideas into dBase II specifications and commands, or Cobol statements, and it costs £220.

Its inventors, working for a company called Stemmos, say it's the most powerful software of its kind — that kind being program generators — in the world. I suspect them of bias, but they claim 2000-plus customers, so far, and are reckoning to sell another 10,000 copies by the end of the year. So maybe the bias is justified.

Details on 01-740 9444.

Well researched homework

One side effect of the success of the BBC micro (over 100,000 sold in May) has been the growth of people using them in classroom networks. Most use the Acom Econet, since it comes virtually built into the computer.

Now a way of linking Z80 based micros into Econets has

The state of the s

Take a 16-bit processor, 80k RAM (32k user) standard and expandable to 512k, a 3in 320k (formatted) Hitachi drive, built-in 66 col x 8 line LCD display, touch-sensitive 'mouse' plate, integral modem, two operating systems, MBasic and a selection of software in ROM capsules — all as standard in a machine expected to retail at around £3000. Add a 50cps letter-quality thermal-ribbon printer at £700 and a second disk drive at around £500. Now picture the whole system, including printer and single drive, weighing less than 15lbs, running on rechargeable batteries and fitting comfortably into a standard sized briefcase. You've got a Gavilan 'Mobile Computer', available in Britain from October (says Gavilan). The software is IBM compatible and is available in five languages to match the six different keyboards available. Dealers haven't been appointed as yet, but the number to ring for information is 01-

been launched by S J Research (of Cambridge, where else?) starting with the Research Machines 380Z also used in many schools.

The most obvious use of the interface is to share 380Z disks. Typically, schools have only one 380Z but with reasonably large disks, whereas the more numerous BBC's disks are still more like hen's teeth than computer peripherals.

Price for software and hardware to do this is £500: to connect a Z80 system to an Acorn network, however, is rather cheaper at £153 (VAT extra).

instructions, which clearly state that we want a direct printout. But you can't afford the printer until we publish your program!

What you need is a friend with a BBC and a printer. Failing that, try Beebprint, a company in West Sussex set up by enthusiast Bob Sampson, who has a printer, and will charge you £2 or so per program up to 32 blocks long. He will even do a screen dump of whatever part of the program you want to have printed for 50p extra (if you include a line saying VDU2:CALL &DOO:VDU3 at the appropriate point).

Details on (0273) 833397.

Showtime

Last month we gave everyone the tiniest peek at what will be in store at the 6th *PCW*Show. For those who haven't yet heard, the Show is from 28 September to 2 October, but members of the public should remember that the first day is a trade day — nobody outside the computer business will be admitted — but there are still four other days to choose from . . .

Last year the Scrabble contest was run using just the Apple II. This year games mogul John Baldachin of Little Genius will be presenting the Scrabble program on the Spectrum, T199/4A and one other micro — so you can choose your favourite.

Entering the contest will be much like last year — you go along, fill in a card and wait to play. The four prizes will be presented at the end of the last day. All winners will receive a Chambers' Dictionary and the first three prize winners will also be awarded a different computer each — we don't know what they are yet because it's a secret.

It's quite a challenge, though — last year the computer was, in score terms, the undisputed winner, with 503 points. Bearing in mind that competitors will only have two minutes to move, this is pretty hard to beat. Dealers in the Show will be selling the program, which is not available from the Scrabble feature

itself.

Business Computers you can afford.

At last here's a range of true business computers are realistic prices. Sanyo desk top micros give you a choice of 8-bit, 64K RAM or 16-bit 128K RAM, expandable up to sanyo's reputation for quality products, thoroughly in bility is backed up by Logitek's experience and service.

Library of Faculty of Mathematics - University of Belgrade

elibrary.matf.bg.ac.rs

Logitek has a strong reputation for reliable products and a high level of customer support. 100 Logitek dealers are backed up by a national maintenance service, and in-house support on operating systems and applications software.

Logitek are the top distributor for Altos micros, and Peachtree software and the new Landmark multi-processor micro complete the range with full compatibility of operating systems and applications software

Address And Standard Corner of the Corner of Here are real business computers at an affordable price-get one on your desk now.

- Choice of 8-bit or 16-bit
- 320-640 Kbytes on floppy disc
- Expandable up to 1.2 Mb
- True 8086 16-bit processor
- Peachtree accounting software
- CP/M, CP/M-86, MS-DOS
- operating systems
 Price from £1195 to £2450

Sanyo technology plus Logitek support

ASHTON TATE DEBASE III

The world's leading micro database package can now be enhanced with 3 new products

Fox & Geller, the world's largest suppliers of dBASEII add-ons, are now established in the UK to supply and support

QUICKCODE

The dBASE II program generator.

QUICKCODE writes concise programs to set up and maintain any type of database. You still have all the power of dBASE II and there is no programming required. Draw your data entry form on the screen and you're in business – it's that simple. The most powerful program generator available. And the easiest to use. QUICKCODE makes dBASE II easy.

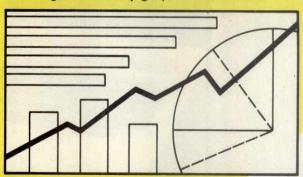

dUTIL

The dBASE II utility program. dUTIL automatically combines your dBASE II command files, saving disk access time and speeding up your programs. dUTIL makes your listings more readable by automatically indenting and aligning command sequences. Makes debugging that much faster. dUTIL also cuts out repetitive programming. Simply type your instruction sequence into a standard text file—then INCLUDE it in as many dBASE II command files as you wish.

dUTIL makes dBASE II faster

dGRAPH

The dBASE II graphics system. Now you can bring your dBASE II database to life! Produce pie charts and bar or line graphs in minutes and with ease. Advanced features make dGRAPH as powerful as it is easy. Features like autoGRAPH which will automatically load dBASE II data, compute scales, draw grid lines and label charts. Then there's automatic shading and overlay graphs. And more.

Easy to use dGRAPH makes dBASE II better to look at

Dealers - contact your Fox & Geller distributor for more details:

Encotel 01-680 6040 Ferrari 01-751 5791 Midlectron (077382) 6811 Pete & Pam 01-769 1022 Software Ltd. 01-833 1173 Soft Option (0476) 860171 Tamsys (Windsor) 56747 Tradesoft 01-627 1800 Xitan (0703) 334711

This will be the 4th European Microcomputer Chess Championship.

Many of last year's exhibitors will again be taking part, among them ACT, Acorn, Pete and Pam Computers, Peachtree Software, Sinclair, Atari, DEC, Camputers, Microwriter and Sharp. New exhibitors will include Oric Products, Psion, Mattel (probably exhibiting its micro, the Aquarius) Micronet 800, and several more new and hitherto unheardof companies who will no doubt be displaying interesting software. add ons, books and all known paraphernalia for your micro or the one you might just buy at the Show.

Don't forget that we've only listed a minority of the exhibitors — there will be many more to see. All in all, it looks like visitors to the *PCW* Show will find just about anything they could want for whatever micro they may have. See you there (if we're not hiding in the lounge again) . . .

Micronode launch

The UK office systems company Xionics has announced Micronode, a network of local area networks (LANs). Each Micronode processor can support between two and eight users sharing winchester, floppy and printer', the maximum number of linked Micronodes being unlimited for all practical purposes.

The LAN is via Xionics' own Xinet, and Micronodes are linked to each other by a public switched telephone network (PSTN). The main selling point of the system is the library of communication protocols which will enable it to talk to other machines including IBM, ICL and DEC mainframes, Viewdata and Telex Message Switches. together with selected word processors and micros. The IBM PC is scheduled to be the first. These protocols will allow a Micronode workstation to emulate whatever it happens to be plugged into be it a humble word processor or an IBM mainframe.

The operating system that achieves these minor miracles is being kept a closely-guarded

Mike Bevan wouldn't so much as tell me the name of his OS. The company will, we are assured, be making an announcement 'shortly'.

An entry level system costs under £10,000, for which you get a Micronode, software and two workstations. Details on 01-636 0105.

Surya

Golden opportunities

On 22 March, 1982, Telecom Gold was launched to market British Telecom's Dialcom Electronic Mail Service.

Telecom Gold — now in its second year — has become firmly and successfully established with some 175 client accounts, who together constitute a user population in excess of 2500 mailboxes.

The success of Telecom
Gold to-date has been based
primarily on the *Mail* service,
the store-and-retrieve mailbox
capability. This however, is
only one of a number of services offered by Telecom
Gold through its Londonbased computer timesharing
service.

The Dialcom Electronic
Mail software extends, in fact,
to cover products for
calendar/diary scheduling;
notice/bulletin board; database
management systems; phone
messaging; forms design and
processing and across user
'chat' facilities.

Most significant has been the development of software providing interworking capability from *Mail* to such British Telecom services as Telex, Telemessage and Radiopaging. All these interworking products are currently completing their trials and final market tests. Early commercial release of these additional interworking products is planned.

For further information, contact: Sales Administration, Telecom Gold Ltd, 42 Weston Street, London SE1, tel 01-403 6777.

Dragonalia

Come August those McCaffrey Dragon freaks among you will be able to buy a game of the Dragon civilization of Pern to play on your home

Transtec Computers has just announced its new range of micros: the Krypton series. The standard micro is a 64k, Z80based, CP/M machine with a memory-mapped 80-column display, user-definable characters and 17 fully programmable function keys. Options include CP/M Plus and USCD-p operating systems, floppy and hard disks and a choice of either a 128k or 256k RAM disk. The operating software supplied with the RAM disk is CP/M transparent and the disk is accessed as drive E. As an indication of its speed, MBasic loads in approximately 0.5 seconds. This, says Transtec, makes it ideal for storing overlay files, where the time taken to access floppies can be extremely irritating. The availability of Telemaintenance, a remote hardware and software diagnostics facility using an acoustic coupler, is being heavily stressed by the company. The basic machine costs £1695, and the RAM disk is £325 for 128k and £450 for 256k. Details on Dublin (0001) 718521. Surya

Anne McCaffrey has just given games manufacturer Epyx the licence to market a game incorporating the two-stomached, firestone-eating, phosphane-breathing dragons. It will run on machines from Apple, Atari, Commodore, IBM and Tandy, and will cost \$29 or the UK equivalent.

The game is set on the feudal planet Pern, where the dragons and their human riders live, and which is subject to invasion by wormhatching spores.

Anne admits that she doesn't have a world monopoly on dragons, only on firestone-eating, phosphanebreathing ones. She is extremely circumspect about to whom she grants licences, and the Epyx deal follows unsuccessful attempts to sign her dragons up by Atari and other games manufacturers. She feels very personally attached to her dragons and won't authorise any games which aren't in the true spirit of the Pern civilisation.

Ten million of Anne's
Dragon books have now been

at a convention in Baltimore, Maryland and discovered she was a cult figure. People at the convention were singing dragon songs and wearing dragon costumes. Now there is a whole subculture of 'dragonalia'.

Anne has just finished a new dragon story 'Moreta, Dragon Lady of Pern', scheduled for launch in October. Jane Bird

I would like to address this convention on: 'Anne McCaffrey, Myth or Legend?'

COMMUNICATIONS

PCW welcomes correspondence from its readers but we must warn that it tends to be one way! Please be as brief as possible and add 'not for publication' if your letter is to be kept private. Please note that we are unable to give advice about the purchase of computers or other hardware/software—these questions must be addressed to Len Warner (see 'Computer Answers' page). Address letters to: 'Communications,' Personal Computer World, 62 Oxford Street, London W1A 2HG.

What's in a name, sir?

Dear World, I address you as such as your editor, or at least the individual responsible for the letters page, seems to have taken to (very rudely) addressing correspondents solely by their surnames. While I appreciate that there are probably a lot of wallies who write to you, surely it is not to much to be polite to your correspondents if you are going to publish their letters and your replies? I have to say that I have detected more than a little arrogance and 'incrowd' attitude creeping into your magazine of late. At risk of being thought over sensitive, may I suggest that this will probably not do very much for your circulation figures? Yours faithfully Dr J B Brooke (or to you, my boy, Brooke), Nottingham

Humblest apologies! Grovel, grovel — Ed.

Bad example

Your office pedant, Steve Mann, done it on purpose, didn't he? You know, wot he wroat about us illiterates. (If in doubt GOTO page 183, May 1983 *PCW.*) It were good on him to rush to the defence of. . .

Excuse me, does the 'its' refer to the English language, the losing battle or the computer industry?

Let me rush over the five (or is it six?) cliches in the first paragraph because I see in the middle column 'at most, a couple of sheets or a cassette insert'. If the 'couple of sheets' is 'at most' can the 'cassette insert' also be at most? Isn't the one more 'at most' than the other?

distracted by 'riddled with errors'. What a lovely picture — or perhaps 'riddle' here is not rhyming slang for 'leak'. I must consult the dictionary. Riddle = question, etc,designed to test ingenuity. It is doing that, Riddle = coarse sieve: to sift. Neither of those seems to fit. What's this? Filled with holes. That's better - he's talking about punched cards. No, wait a minute — filled with faults. So the document is filled with faults, with errors. (My dictionary has an entry for 'riddling', that is, puzzling: that's no lie.)

We are told that 'children can only learn by example'. Quick, someone, and tell the government that all this money they are spending on computers is not needed — we have the authority of *PCW* for that.

'This is the case. . . ', 'this is not the case. . . '; 'in most cases. . . ': we have enough cases to overload a forklift truck or a court calendar. 'True' or 'false' gives that 'clarity of meaning' (tautology) that is 'the one factor of prime importance' (tautology again) that Mr Mann seeks.

I have lost count of the number of cliches and of that unpardonable offence, the ambiguous pronoun, seen in the sub-title and near the end where an 'it' is parted from its noun by fourteen words.

At first I thought Mr Mann was showing us by example what happens to a pedant compelled to read too many 'computer-related products'. (Those are the black lines on the coffee jar, I suppose.)
Then I read the next article.

'Shirt Pocket Casio' sounded more intimate than user-friendly. 'At the top end of the portable computer' was as far as I read before I was attracted to the heading 'Documentation'. In that I read '... the normal flimsy affair...' is '... quite complete'. Is it complete or not? Mr Pountain

Japanese and English texts to be able to justify his 'better translated' accolade but what does he mean by 'translated on average'?

Is the 'sizeable pocket book' measured in metres or inches?

'It (presumably the small program library at the end) is quite readable' which is more than I can say for Mr Pountain's review. Then, as if he has been hypnotised by the manual (or paperback or program library), he writes '. . . is slightly stilted in prose style'.

Several of your contributors complain, with justification, about the quality of paperware supplied with hardware and software. A higher editorial standard in PCW might educate the industry. RIRO (or do you prefer GIGO?) applies to writers as much as to computers. Mr Mann's comments about the education of children are more pertinent to the industry than to schools. In theory schools haves teachers to correct mistakes.

H J M Langshaw BSc MIS-TC, Technical Author, Dartford, Kent

Oversight

I started reading with interest Mike Liardet's article on Microsoft's Multiplan (PCW April 1983) and was greatly surprised to find that there was no mention of one of the very first micros to adopt Multiplan, the Olivetti M20 (although using a different operating system). This is even more surprising when one recalls the fact that the M20 passed PCW's benchmark tests with flying colours - evidence of this was produced by the PCW benchmarks' summary in the December issue, when the Olivetti M20 was top of the list out of 63 machines tested.

The M20 is also conspicuous in the absence of any reference to it, except when

dent dealer decides to place an advertisement in your otherwise very informative magazine. I wonder why! Brian J Darmanin, Sliema, Malta.

No discrimination intended here — although the M20 is enjoying a big ride on the back of the PCW benchmarks — Ed.

Universal disappointment

I sympathise with B Kemp's letter 'Bad bugs bite back' (May 1983) concerning the trials and tribulations of Bug-Byte's 'Space-Warp'. I have this tape and am bitterly disappointed.

The graphics are almost non-existent; the space craft on the cover only appearing as a file at the end of the tape.

The space craft tends to fly wherever it wants, especially when flying at warp speeds.

Your score only appears on your destruction, a rare occurrence due to the limited number of foes. It can be very frustrating, flying about an empty universe! B Kemp should think himself lucky that he never received a working copy.

Andrew Hardy, Bingley, West Yorkshire

Useful tip

I recently ordered the language 'Lisp' from Acornsoft for my BBC Model A. When it finally arrived I was most disappointed to find out that it apparently did not work. Upon further investigation I discovered that if the interpreter is loaded into a Model A machine, the text window set by the usual Acornsoft header page is not reset, and so, although the interpreter is working, the text window is so small as to disvice this fact

COMMUNICATIONS

The solution I employed was to alter line 120 on the second Lisp program to: 120 PROC oscli ("LOAD IMAGE" + STR\$ — (imbot % *&100)):IF HIMEM< &7C00 THEN mode %=7:GOTO 150.

I hope that this will be of some use to your readers.
G Philip, Bangor, Gwynedd

Reader's digest

We were interested to see the use of biotechnology in computing. In fact HCCS Associates (*PCW* April 1983, page 317) seems to have a really 'gutsy' machine with its 'Colon Genie'.

DCE Kennils, Biology Laboratory, Old Swan Technical College, Liverpool

TRS-80 forum

I have a TRS-80 colour and DMP 100 printer to which (all being well) I will add disk drives by the end of this year. I am very pleased with the system and unlike your unformnate reader Mr H J Leckie in the May 1983 issue, I am very satisfied with the service that I receive from my local branch here in Brussels. If I ask for something not in stock I normally have it within five to seven days. One example was that I asked for the printer on a Thursday evening around 6.30pm and I took delivery on the Saturday. The only thing it has fallen down on is getting me an assembler/ editor pack as there are none in Belgium at the moment.

The thing that I find strange is that I have not seen any programs in your program section for the TRS-80 colour. No, I am not mistaken; I have just completed checking all the issues I have, so the question arises 'why?', as I find it a reasonably versatile low cost system which I use in numerous ways for my personal entertainment and selfeducation of programing as well as the primary function my business needs for reports, files, etc. Admittedly the process is a bit slow at the moment without disks, but it is certainly not stopping me.

I would be interested in hearing from other TRS-80 colour owners as I get the

being left out in the cold in favour of bigger names such as Apple, ZX81, BBC micro etc.

I would also be interested in your comments as a leading computer publication. W J Brown, Brussels.

See page 231 The Domain of the Djinn, but why don't you send PCW some TRS-80 programs? — Ed.

Future plans

Now that the Spectrum has come down in price, is Sinclair planning to launch another colour moving-keyboard computer? Could it possibly be a 16-bit IBM compatible? If so, my wallet is ready. Can you please find out?

CC Kuan, London

Over to you Sinclair - Ed

Tandy feedback

Mr Leckie (May 1983) asked if his problems with getting spares for a Tandy computer are normal. I have been in charge of a lot of Tandy computers which take a battering at the hands of school children and I have a love-hate relationship with Tandy. The good part is that if you have a serious problem, you know that Tandy will fix it quickly and at a reasonable cost. If it is an obscure fault that is difficult to find, then it seems to replace the whole motherboard for a reasonable price and save the expensive labour costs. Even one that went up in smoke, after the best part of a glass of coke had gone inside, came back the following week with an affordable bill. On the other hand the company charges the earth to fit a lower/case chip which costs a few pounds from an independent supplier, and its official memory expansion is based on the times when chips cost four times as much as at present.

Tandy seems to fall over backwards to protect its customers from themselves, and this is the root cause of its disclaimer on CPUs that have been opened by the user. It is also true that the UK comUSA head office. Parts that are not available over here can be obtained from the USA by return of post.

So, Mr Leckie, you can at least thank your lucky stars that you have a TRS-80 and that Tandy only lost your letter. I sent a BBC computer back and it lost the computer for weeks.

Derek Tomkins, Maidstone, Kent

Epson praise

Late last year after reading various reviews including one in *PCW*, I bought the Epson HX-20. I was very pleased with it and after writing the two programs which I wanted for the computer, I awaited eagerly the Epson programs and interface to a TV. (I' remembered that the programming instructions in the manual mentioned various instructions to a TV monitor.)

As far as I can see, and having discussed the matter with Epson, the TV interface is nothing more than a figment of the company's imagination. I think the advertising authorities should be made aware of Epson's practice of advertising items which simply do not exist.

While waiting for the Epson programs, namely, 'Correspondent' and 'ECalc', I tested a program called 'Intext'. This is a text editor from Talbot Offset in Bournemouth. Unfortunately, I obtained an early version of this program and on using it with the expansion memory of the computer it caused all sorts of problems. I found that I could not even re-set the computer at one point and had to disconnect the battery to regain control of the computer. It also used only twenty columns of the Epson screen which made tabulating columns of figures very difficult. Also controls could be inserted to underline and centre, but I found these extremely difficult

The program also had a welcome feature enabling the width and length of the paper to be set.

Having recently contacted Talbot Offset I was assured that the newer version of the program has been improved and that the controls are easier, but I have yet to try

At last I have obtained ECalc and Correspondent 20. These programs, I think, must rate as the biggest insult to the Epson name.

ECalc is a program written in Basic which endeavours to emulate VisiCalc. It is so slow as to be almost unusable. Its other faults are that the user has to be extremely careful as there is no way one can retract a miskey to an option. It is also sadly missing the feature @SUM [...]. In ECalc to obtain a list of additions into a cell one must define all the other cells. The program did request the printer controls, but only a maximum of eighty columns, thus not using the feature on some printers to print in excess of eighty columns. A page selected in excess of eighty columns is wrapped around, thus making reading difficult. However, as the program is written in Basic, it is very easy to correct this deficiency.

Going back to the matter of time taken on replication or recalculation: to copy the formula A4=A1+A2+A3 to columns B and C takes over a minute and in serious use replication can take between five and ten minutes! This makes nonsense of using a computer to do work which can be done faster by hand. Even thought the Epson is smaller than say the PET or Apple, the capacity is almost the same with the expansion memory fitted and thus I can only attribute these deficiencies to a badly written program. (I appreciate that tape storage is slower than disk.)

Regarding Correspondent 20, this is the Epson text editor which uses a page, sixty lines by sixty columns. The screen operates similarly to a piece of paper in a typewriter. A bleep sound is heard indicating that the end of a line is approaching and the operator has to make the necessary adjustments to the text. The result is that while editing the text, all the adjustments previously made are non effective and then every line has to be checked, correcting where the words are split or where unwanted paragraphs have occurred because a sentence has been lengthened. If editing is this difficult, it could be advisable

COMMUNICATIONS

centering or underlining facility and neither is there any right justification.

The version I had was on a ROM cartridge and, as the control to the RS232 was fixed, only by altering the program each time could I make my printer operate.

A pleasant feature of the Correspondent 20 is the way the keys are used to search and move within the screen, a directory is created at the beginning of the microcassette and all the filing of the texts is carried out automatically by the program. Unfortunately even this has a draw back in that the tape duly initialised with the directory must be inserted before even a letter entered into memory can be printed; if this is not done the text is lost.

All in all Epson has a good product but with little decent software to use its potential. I suppose I'll just have to wait for other people to write sensible and well thought out programs which work.

J G Feingold, Salford, Lancs

For more comments on ECalc see Mike Liardet's review on page 164 — Ed.

Short supply

I am writing to bring to the attention of your readers the current situation regarding the supply of software for my machine the Acorn Atom.

I ordered the cassettes advertised for Forth and Forth utilities from Acornsoft on 19 November, 1982. Here I am six months on, and no sign of the order being fulfilled. My letters to Acornsoft are answered promptly, but they always say the same thing that they are waiting for supplies.

Thinking that Acorn dealers would be able to help, I found on contacting several that there is a widespread problem in obtaining software and hardware, particularly hardware peripherals for the BBC machine.

My experience of this situation in other walks of life usually indicates that a company that cannot meet demand, and is unable to make improvements is in financial difficulty.

financial difficulty.

out, it may be deliberate policy to neglect software to encourage Atom owners to buy BBC machines.

It would be helpful to readers if you could get a statement from Acorn on its policy on software for past, current, and future machines. In my opinion, the companies that will survive in this business will be the ones who demonstrate their continuing support for their customers. John Ferguson, Chelmsford, Essex

What's the score then Acorn?

— Ed.

Communicating by sound

As originator (and now managing director) of Head-Line Communication — the company responsible for the 'Sound Training' packs, I was naturally very interested in the Steve Harris feature 'Learning by Ear' (May 1983).

But before commenting on your review of our 'WordStar' Sound Training product, I would like to clear up a possible misunderstanding. The retail cost of the Sound Training pack is not £23 as you reported but £33.50 plus VAT. All Sound Training products are in fact available from sole distributors, Newtech Publishing, 8 Camp Road, Farnborough, Hants.

So much for the 'commercial'. In the cause of making some interesting and often valid observations, your review suggests that our selection of 'help level zero' is too low and that it should have been possibly pitched at 'help level three' which would be rather more practical. While taking the point, I still believe that selecting 'zero' is correct for our planned training approach. I would, however, like to point out that the Sound Training pack which you kindly reviewed was, in fact, an 'original proof package'. Since then, the product has been considerably revamped and hopefully most of the comments of both reviewers and early users have been taken into consideration and amendments made.

The sales success of the

belief that the interactive training method is not only different from all others, but is one which is increasingly meeting the needs of the first time or inexperienced user.

Hopefully PCW will be prepared to 'plug in your tape recorder, sit back and listen' to our latest product, the Sound Training 'MailMerge' pack. Here, I hope you will agree we have taken a rather imaginative approach to what is a somewhat complex and often intangible software product.

As Maggie Burton comments in the same issue, 'Audio courses are an easier option than reading a book', or as we would add, following the manual.

John Campbell, Managing Director, Head-Line Communication, Hereford

Legal defence

I was amazed to read the letter from Brian Hurley (Communications May 1983) where he goes on at great length about copyright infringement and the rights and wrongs of copying programs, then he admits to having no legal background, and no connection with the authors of the book in question. It seems quite obvious that he has no connection with the Sharp MZ-80K either, because some of the tips which prompted his irate letter simply do not do what they were intended to do - as Anthony Newgrosh got some of his addresses wrong. Surely if one is going to make such a stand for what is right, one should at least have a little knowledge on the subject to start with. Does Mr Hurley actually own an MZ-80K, or indeed any micro, or is he just one more person wanting to jump on the software piracy bandwagon.

If Mr Hurley really wants to know about software piracy, I'll show him how to get a listing of a commercially integrated accounts package in MBasic which would cost anything up to a thousand pounds; or how to make as many copies as he wants of those commercial MZ-80K tapes.

My point being that anyone can find out such tricks of the trade, but that doesn't mean

copying other people's software. I say 'good luck' to the Anthony Newgroshs of the world; at least they get pleasure from their micros.

The information regarding PEEKs and POKEs on the MZ-80K can be found in numerous computer magazines dating back to the day the machine was first put on the market; or as your reply rightly pointed out by simple experimentation.

Come on Mr Hurley, stick to enjoying computing and leave legal matters to legal minds.

Peter Paton, Burnley, Lancs

PS... Computer jargon definition: Endless loop = an argument about software copyright.

Arcadian delights

Steve Mann expressed in 'Screenplay' (*PCW* May 1983) his disbelief that anybody could reach level 53 on 'Arcadia'. I would like to report that I have reached level 173, gaining a score of 199,292, with only five ships provided initially. I would also like to report the first recorded case of what I am sure will soon be a common complaint 'Arcadian wrist'.

One point not explained by 'Imagine' in the documentation for the game, is the names of the various species of 'Atarian' attackers. To remedy this I would like to suggest the following names, which are now in common usage in this household. They are, in order of levels (level one first): Arrows, Bow-Ties, Round-Shouldered, Dancing Hurtles, Walking Sticks, Birds, Boxes, Eiffel Towers, Flower Pots, Octopuses, Singing Blacks, Boomerangs and Balloons.

Finally, I would just like to say what excellent value 'Arcadia' is; I would recommend it to anybody owning a Spectrum.

Ivan Mactaggart, Yeovil, Somerset

CTUK! NEWS

From its humble origins CTUK — Thanet has grown into a thriving success.

Peter Kiff, its organiser, gives a synopsis of how and where it all began.

ClUK — bringing computer literacy to the whole community. It was only when we sat down and considered that aim that we realised what an enormous job it would be. We would surely fall short of our objective. Besides, we asked ourselves, what exactly was meant by computer literacy? Did it mean learning to program computers? Did it mean learning how computers work? Or was it rather finding out about the role of the computer in our fast-changing society? Probably it involved all of these and many more aspects beside. Then again, did the whole community want to be made computer literate? Would it not be possible for other organisations with more money, time and expertise than us to do the job more efficiently?

at was with some feelings of trepidation but lots of enthusiasm that we expressed our wish through the CTUK page of PCW to form CTUK Thanet serving the island and its seaside towns of Margate, Ramsgate and Broadstairs. We received a few letters expressing interest in reply, not exactly an overwhelming response, but one was just what we were looking for. The local area librarian had spotted our announcement and had decided that computer literacy had a place in Thanet's libraries. Thus began a very fruitful partnership in which we have had every encouragement and lots of friendly cooperation from the library staff.

It was decided that we would hold meetings every Friday evening in Broadstairs Library, which is a fairly central venue for the Thanet community. We had the choice of

using the large entrance foyer or an upstairs exhibition room and decided upon the former, since this would mean that everyone entering or leaving the library had to walk past our computers.

Soon we had a group of people who were expressing an identifiable need, and posing questions such as: How can the computer help my business? How can the computer help my child's education? What can the computer do for me now that I'm retired? They wanted to learn more. At that time no adult education classes were available locally in either computer appreciation or programming. We realised that we had to run our own.

We began a ten week course in Basic; we kept it simple, we moved forward slowly, we always tried to link programming concepts with wider computer applications. We were helped once more by the library staff who provided another room for our courses while our other CTUK activities continued in the foyer.

We continued in this manner for the first 18 months of our operation. Towards the end of this period we realised that there was a need to change our mode of operation. Things were moving swiftly in the world of microcomputers. High Street stores were beginning to stock the machines; the merely curious could drop into the shops on a Saturday morning in between buying the groceries and ordering a lunchtime pint. The local Adult Education Centre began running programming courses. We found that our Friday evening sessions were being attended by the same people each week - mainly

'Computers in Education' day at Broadstairs' Library

youngsters who regarded our set-up as a club. It was always a pleasant beginning to the weekend but not what we had set out to do.

We mulled the problem over and discussed possibilities with the librarian. Eventually we decided, somewhat reluctantly, to abandon our weekly sessions and, instead, begin running all-day Saturday events about once every six weeks. Each of these was to be on a different theme. We felt now that our job was to demonstrate to people how micros could be useful in the home, at school and at work. Owing to the fact that we only needed to organise one session every six weeks, we could concentrate upon providing a really good display of equipment and software. Our thematic approach would give us an opportunity to explore various areas in some depth.

We decided upon 'Computers in Education' for our first Saturday session. It was the beginning of a new school year and the Department of Industry scheme was just being extended to primary schools. We gathered together appropriate hardware: Research Machines 380zs, BBCs and Spectrums. We collected as much educational software as possible. The local bookshop put on a display of books. It looked impressive, but would anyone come? There were a few tense moments as we waited for the library doors to open. Then in they poured - teachers,

children and parents. From 9.30am until we closed the doors at 4pm, there was a constant flow of people. It was hectic but we coped and we dropped exhausted at the end of the day, tired but satisfied with our efforts.

Since then we have run sessions on 'Computers in the Home' and 'Computers for Small Businesses', both of them very successful in terms of numbers attending and, we hope, in getting the message across. Our next session will be an even grander affair. We are leaving our friends at the library temporarily because we need more space, and this the local technical college is providing. Our exhibition there will cover many different aspects of microcomputing. However, we shall be back at the library in September for another Education Day and then I think, since micros are getting cheaper every day, we shall need a 'what low-cost micros can do for you' kind of day, round about Christmas time.

I think we have learnt two important things from running CTUK — Thanet. Firstly, in the fast-moving world of computing one has to be prepared to change to suit the circumstances. Secondly, whatever your locality you need a CTUK centre.

Note: Peter Kiff, organiser of CTUK — Thanet has moved. He is now at Flint Cottage, 2 Ranelagh Grove, St Peter'sin-Thanet, Broadstairs, Kent CT10 2TE.

Computer Town UK! is a rapidly expanding network of computer literacy centres where members of the public are given free access to all sorts of computer equipment. This is courtesy of those willing to offer time/resources. You can find a Computer Town anywhere—they're often in libraries or schools. The aim is to make micros enjoyable and non-threatening, so axe-grinding of any sort is banned. Guidelines are available for those interested in starting up their own 'Towns. Write to: CTUK!, PCW, 62 Oxford Street, London W1A 2HG. Remember to enclose an A4 SAE for your reply. Please don't ring PCW for information as CTUK! is entirely a spare time activity.

BANKS' STATEMENT

ANY OLD JUNK?

Martin Banks rambles retrospectively on the ephemerality of computer hardware.

I woke up this morning and looked at my reflection in the mirror, counted the odd new wrinkle or two that had appeared since the last time I had been brave enough to attempt this feat, and asked myself a question: 'Is it all passing you by, Banksey boy?'

Having decided that it probably was (and I hope at this point that you are beginning to feel slightly sorry for me), I asked myself how this could be. The answer, I decided, was that although I could remember the great events in my life — many of the personal computers I had seen, played with and/or written about in my time as a journalist — there was in the end little tangible evidence of these events.

Unlike some of my compatriots, I never bothered to acquire specimens of these machines as and when they had appeared on the market. Now they are gone, lost to the ravages of time.

Of course some of those machines are better lost to time than attempting to reside here in the present world as working systems. But even they have had their place in the great scheme of things, if only because they were such excellent demonstrations of how personal computer systems should not be designed, built and sold. There are others that could have been successes if only all the factors had been right. If only, for example, the people with the finance a few short years ago could have had the vision and courage that they are starting to show today, now that there is a track record of success to demonstrate.

A further thought occurred to me as I gazed at the vision of loveliness in the mirror (look, I'm writing this, so I'll choose my own adjectives, even if they are pure sophistry). The thought was that, even in the short history of the personal computer, it has built up a tradition and a folklore that are, in their own way, as important and fundamental to the path of development of the industry and products, as Spotted Dick and Morris Danc-

'...if we lose sight of the tradition of the personal computer industry, we will be continually selling ourselves on the next technological gizmo...'

ing are to the way the English are now.

In a world of sanitated, greasy Yukburgers and two-dimensional French flies

— sorry, fries —, Spotted Dick still seems remarkably real and wholesome,

something to be relied upon. It's probably what made the British great. Without it, we might just slide away forever into some fast food shop's chip pan to be processed, sanitated, reprocessed and re-sanitated for ever.

In the same way, if we lose sight of the tradition of the personal computer industry, short in history though it may be, we will be continually selling ourselves on the next technological gizmo, purely because it is the next technological gizmo, and for no other reason: setting ourselves up to be processed, and re-processed, throwing away perfectly good products that actually serve our needs just because they have committed the final, cardinal sin. That sin, of course, is to become 'old' or obsolete.

What actually started off this train of thought occurred back in April. It was the London Computer Fair, a small show organised by the Association of London Computer Clubs. I went along to this affair, not to hunt out new and startling products, for I knew that such discoveries would be rare at such an event. No, instead I went to see if any old friends from the business were around, and to sniff the air among such a large collection of dedicated personal computer

I found some old friends to be sure, but I also met up with something else. This was a stand at the show taken by a company calling itself the Computer Junk Shop. At first I thought this was just another fun name for a company, but on investigation found that it was exactly what it stated, a company dedicated to selling old computer junk.

It was then that I thought 'here is history, and it's being knocked down at only a few pounds a time.'

To be fair, the stuff they actually had on the stand was not part of the essential folklore of the personal computer business. Some of it came close though, and it was all interesting. There were, for example, some old ICL 7500 series terminals going for around £40; there was even a Computer Automation minicomputer (definitely not part of the PC tradition) marked at £500, and an early Video Genie (definitely in as part of the tradition) on sale for £195.

There was nothing on the stand at the show that was earth-shattering or of immense historical importance, but there could have been. What if I had spotted an early Altair or Imsai on sale. Closer to home, what if there had been an old Scamp computer.

Hands up those who remember the Scamp? I suspect that there are probably quite a few of you out there, but many more will know nothing about the

machine. It was made by a company now long defunct (long at least in personal computer terms). The company was Bywood, the brainchild of the late, and lamented, John Miller Kirkpatrick. Today, the Scamp would be laughed at for masquerading as a computer, but with some better backing and some reasonable financial support, Kirkpatrick could have beaten Clive Sinclair at his own game!

He didn't of course, so perhaps it is no good crying over spilt milk, but Kirkpatrick and his Scamp computer have a place in the history of the personal computer business. I feel sure that many of the people presently working in the industry got their early experience on such a machine.

What is needed, therefore, is a museum, a place where all these artifacts of the business can be brought together for the interested to see and study. There are such museums elsewhere — for example, the Digital Equipment Corp has one in the USA — but there is nothing here, and we have contributed at least as much to the development of the

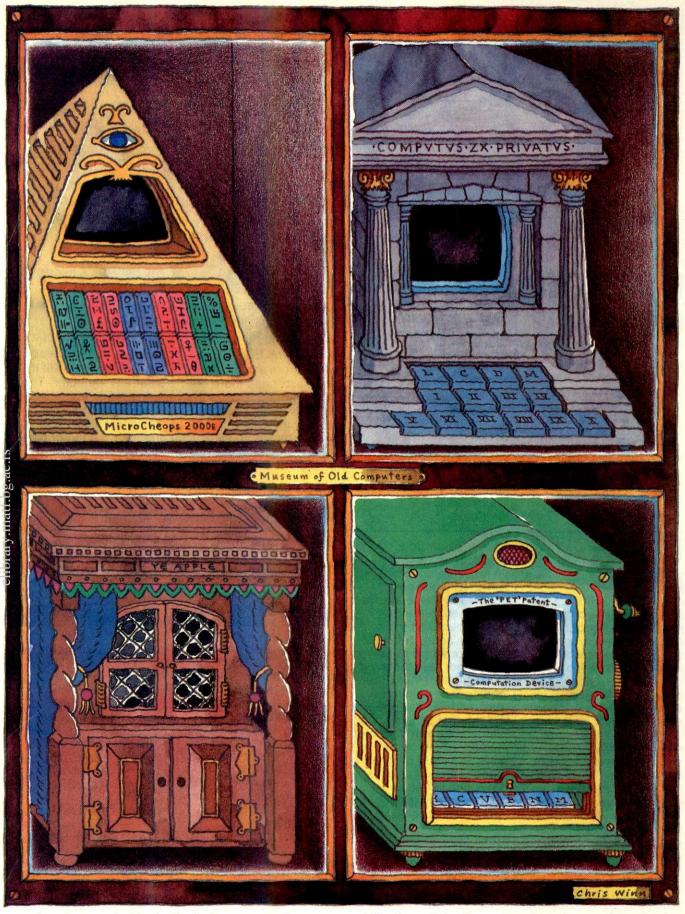

'Much more of what has appeared in the personal computer business should be saved for posterity.'

industry and its products as any one else. There are, to be fair, some individual collections of such artifacts in this country. For example, journalist and writer Robin Bradbeer has one that he has assembled over the years — though, because it has come from his own pocket, or from what he could beg borrow or steal (in the nicest possible way, of course), it is far from complete in its coverage of the industry and its products.

Much more of what has appeared in the personal computer business should be saved for posterity, I feel. It should be kept together in one place where those that are interested in how the products and the industry developed can study the subjects at their leisure.

Ideally, of course, such a museum should be a national archive, though this perhaps is an unlikely hope. I know that the Science Museum carries some displays of this type, but these are far from complete, for the museum has to cover many other areas of science. Indeed, if Robin Bradbeer is to be believed (and why not?), a fair amount of what has been exhibited there has come from the man's own collection. (Perhaps we could start by saving Bradbeer for the nation!)

Failing that, it does seem to me that a

magazine of some standing in the busi-- such as Personal Computer World — could easily be the benefactor. of such a museum, especially if some college or university were to provide the important facility of a place to keep the exhibits

some systems - especially those that take their time in actually appearing after their announcement - run the grave risk of being superseded. They are becoming obsolete before they ever appear on the market. They may never have a place to rest except in a museum!

three years. In each case, the unit price has barely changed.

I'm not saying for one second that this development is in any way bad, but I do feel that when a home computer, offering 16-bit processing, 128k of memory and hi-res graphics on the TV, will probably

contributions as concise as possible. We will pay £5-£30 for any tips we publish. PCW can accept no responsibility for any damage caused by using these tips, and readers should be advised that any hardware modifications may render the maker's guarantee invalid.

BEEB'S SECRET COLOURS

Here is a simple program to display some of the numerous shades of colour which can be obtained using the BBC micro. Colours are mixed by drawing parallel lines close together; the distance between these lines being determined by the step size in line 50.

All the effects are obtained using a two-

colour mode! Mode 5 would enable up to four colours to be mixed at once.

KEY SAVER

I am tired of seeing Basic programs designed solely to set up the function keys on the BBC micro, when there's a far simpler, faster and more efficient method to save the soft key buffer itself.

The function keys should be set up as usual, then the command: *SAVE"FILENAME" BOO BFF

should be entered. This will save Page OB of the memory, where the soft key buffer is situated. The buffer can then be reloaded with: *LOAD

This will not affect a program that is already in the memory, nor will it clear any variables. The buffer loads up to five times faster than an equivalent Basic program, an important factor for those of us not yet blessed with disk drives.

D Alderson

PET TAPE APPEND

A routine to APPEND subroutines or to incorporate parts of other programs into a resident program is one of the most useful routines in any Toolkit indeed one wonders how one ever managed without it. There are occasions, however, when a TAPE-APPEND can be very useful, eg, if your PET does not have a Toolkittype ROM installed or, if like myself, you have decided to upgrade your Toolkit by installing a chip such as COMMAND-O, only to discover that the APPEND function will now only append from disk and not from tape.

There are at least two popular ways of APPEND-ING tape program files but they are both a little 'messy' in their own ways: (i) The Butterfield MERGE routine in which the subroutine to be appended is converted first into an ASCII file and then read back as if they were being entered via the keyboard. As a MERGE routine this is fine but it

have to undergo a conversion process first. (ii) Machine-code APPEND (such as detailed in Raeto West's Programming the PET/ CBM) operates by loading machine code, then loading the program to be appended, then 'hoisting' it into high memory, then loading the 'main' program and finally 'appending' the first program by bringing it down from high memory to tag on to the tail of the main program. If one is working from disks, this is fine as access time is quick but in tape the process is very much slower and prone to error. The routine to be

developed here works in the way that you might expect it to work, ie, with a program already held in memory it is possible to APPEND another program straight on to the end of it as though one were using the Toolkit type APPEND. The routine is compact (some five or six lines of Basic) and can be entered in direct mode if necessary. To explain exactly how it works a little knowledge of tape

stored on tape, the program header has the structure as shown in

Locations 635-636 in the first cassette buffer store the 'start' address for the load and this is usually 01 and 04 (=1025 decimal,

ie, start of Basic program area). Locations 637-638 store the 'end' address for the load. It is possible to examine the header for any tape without loading the main program by typing OPEN 1 (or more fully, OPEN 1,1,0"PROGRAM NAME") and then examining the bytes in the monitor (SYS 4 and then M

This tape-append routine works by opening the file of the sub-routine and recomputing new 'start' and 'addresses' for the load so that the sub-routine will tag onto the 'tail' of the resident program.

Explanation of the program:

027A-029A).

Line 4: As Basic programs end with three zero bytes, this routine works through the link pointers to ascertain the position of the middle zero.

position of the new program.

Line 5: Requests the name of the subroutine (in A\$), copies it into B\$. Note the three shifted spaces and three cursor lefts in the input string so that a null return will result in A\$ holding a shifted space (ASCII 160) and therefore not dropping into direct mode. If the tape to be appended is at a known position one can utilise this by pressing RETURN only.

Line 6: OPENs the tape header of the named (or next) tape-file and prints out (in reverse) APPENDING (PROGRAM NAME). The new 'end' address is computed and the low and high bytes of the new 'start' address are poked into position.

Line 7: The low and high bytes of the new 'end' address are POKEd into position and the end-of-Basic pointers updated so that the composite program can be saved if

SHARP LOWER

One of the prices to be paid for the Sharp MZ-80K's excellent set of graphics characters. which makes some of the new generation games machines look stupid, is a hideously deformed set of lower case ASCII character codes. This can make such things as driving printers and communicating with other micros much more complicated than they need be. Fortunately, the MZ-80K is provided with an extra character set, the display code or graphics set. Although they are not in the same place, this set at least has the lower case letters in the right

order. Occasionally, you see enormous programs to convert from one character set to the other. These are completely unnecessary, as the MZ-80K monitor (SP-1002, I don't know about earlier versions) provides the conversion routines itself, "?ADCN' and "?DACN' at OBB9H and OBCEH respectively. Therefore, to convert Sharp ASCII to Standard ASCII, and vice versa, all that is necessary is to transfer and adjust. This subroutine takes a

Sharp ASCII lower case letter in the accumulator and converts it to a standard ASCII lower case letter in A:-CD B9 0B NONSTA: CALL OBB9H ;Sharp ASCII -Display code

D6 20 SUB 20H : Display code — Standard ASCII C9 RET

And this one take a Standard ASCII lower case letter in A and converts it to Sharp ASCII:-C6 20 STANON:ADD A,20H; Standard ASCII -Display code

CD CE OB CALL OBCEH: Display code - Sharp **ASCII** C9 RET

A simple routine will be needed to check that the character being treated is in actual fact — a lower case letter. Stephen Morris

Following all the interest that seems to have been generated by possible uses of the user defined keys on the BBC micro, here is a short program which can be saved and loaded in the normal way and does save a lot of time and frustration:-10* TV 255

20* KEY 0 OLD: M MODE 7: M: N LIST: M

635 636

Start Identif- Start ication no Address

634

KEY 1 CLS: M RUN : M

40* KEY 2 MODE 7: M LIST

Obviously this can be changed and extended to suit any particular user's needs but all of the keys must be loaded on separate basic lines as the computer does not respond to colons when it is working in the operating system.

John Carey

Name (16 characters long or name + space = \$20)

routine to complete the load (the headers having been adjusted) and another routine to re-chain the program lines (versions for Basic4 and Basic2). If your version is only going to be used on one version of Basic, then one of these lines can be dispensed with. The CLR and END statements are important! Basic 1(Old ROMs) should

subsitute SYS 62403:

SYS 50227.

Notes:

- 1 Line 3 is included so that the newly augmented program will skip the APPEND routine and go direct to line 10. It can be added later if you wish. If you include line 3 then activate the APPEND with RUN4.
- Your sub-routine should start at line 10. preferably with a REM. If you leave a line 10 REM in your APPEND

Fig 2 will delete the first of these leaving the (newly appended) line

10 in place.

3 Your APPEND routine can be used as many times as you like to append further subroutines. The responsibility is yours, however, to ensure that the numbers are in ascending order before the process is started.

To APPEND in direct mode is fairly easy but you must be exact! (a), (b), (c), (d) represent lines typed in direct mode assuming a program resident in memory: see Fig 2.

Disk APPENDS are documented in Commodore Computing (July 1982) p4 for Basic2; Commodore Computing (October 1982) p4 for Basic4.

BETTER PET GRAPHICS

As a teacher of science, one of the major facilities which I require from a microcomputer is that of graph plotting. It is also most useful to be able to label and put scales on

graph axes.

This facility is most important, both in the context of simulated experiments (eg, simulation of the decay of radioactive isotopes), and in direct experimental applications. An example of the latter might be taking readings from a temperature probe

connected to the microcomputer via an A-D converter, and plotting the results in graphical form. (I feel sure that other microcomputer users can instance many important applications of graph plotting other than in science teaching.)

The science department at Earl Shilton College owns a PET 4016 computer. Other PET users will know that one of its major drawbacks is its limited graphics. The PET Basic provides only the TAB function for use in graphical displays. The usual solution to this problem is to plot the graph with the Y axis across the top of the screen and then plot the X axis and the graph points together, line by line, down the screen; an altogether unsatisfactory procedure (see Fig 3).

Labelling and putting scales on the axes is even more unsatisfactory. (Try it for the function above).

How much simpler this whole business would be if the PET was equipped with the PLOT and PRINT AT functions which are now available on some other, often less expensive, microcomputers.

Of course these facilities are available for the PET (as, too, are highresolution graphics) at a price. However, one is loath to spend extra money, especially at a time when school funds are under considerable pressure.

After hearing of my dissatisfaction, Graeme, a former student of the college waiting to go to university, took two days to come up with two Basic routines which, when included in program, give the PET a full PLOT facility and a full PRINT AT facility. At the same time, the plotting density of the screen is doubled, ie, the 40 x 25

screen is converted to an

two routines are listed below.

PET double density plotting routine (Basic): The variables XX and YY hold the x and y co-ordinates respectively of the point to be plotted.

The co-ordinates (O,O) lie at the bottom left of the screen and the x and y co-ordinates must lie in the ranges of 0 to 79 and 0 to 49 respectively on a small-screen PET. If coordinates outside these ranges are supplied to the routine, it will simply return them to the main program without attempting to plot them.

Before the routine can be used in a program it must be initialised by performing a GOSUB to line 50090. This need only be done once, before the routine is used for the

first time.

The routine itself is accessed by setting up the XX and YY variables and executing a GOSUB to line 50000. As a simple example,

the program below plots a

vertical line UP the screen from (5,0) to (5.49). (see Fig 4). PET "PRINT AT" routine: A much more straightfor ward, but nevertheless useful little facility. This now returns to the normal screen size of 25 lines (0 to 24) and 40 columns (0 to 39) with (0,0) at the top left-hand corner; for example, this program prints EARL starting at line 20 column 12 (see

Fig 5). The only disadvantage of the PLOT routine is that being in Basic it is rather slow. Graeme soon became dissatisfied with this and within another two days had produced a machine-code version of the routine and a version in data statements.

Selling the outside is one thing . . . knowing the inside is something else.

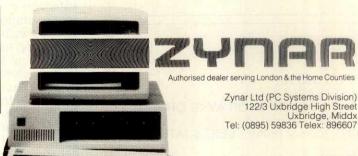

The IBM Personal Computer is a very special micro. Here is a machine of technical excellence - a standard which others will be measured against. It's not surprising that such a product demands professional sales and service back-up.

Zynar is well established at the forefront of personal computing. Our network systems lead the field in Europe and the USA - our design group networked the Personal Computer even before its UK debut. We are professionals, having worked for many years in the computing and 'chip' industries.

Zynar will help you optimize the easy-to-use hardware and lead you to the best software solution: tailored, off-the-shelf, simple or sophisticated.

The Personal Computer has been worth waiting for. You will know it. IBM knows it. And we know it - inside-out.

Shift

BEEB TELETEXT CONTROL

Mode 7 is the most useful mode for displaying title. pages and instructions which do not require hires but can benefit from colour. The problem with mode 7 is the difficulty of putting the control codes which create all the special effects into PRINT statements. There are two ways in which this can be done, either with CHR\$ or by using the red f-keys to produce the codes for direct inclusion inside guotes. Both have their disadvantages: CHR\$ takes up a lot of time and space; direct inclusion can make editing confusing. In mode 7 the control codes take effect and in other modes they merely appear as spaces invisible to both the program mer and the COPY key.

That's the problem... now (for owners of OS1.00 or better) the solution! First, the easy bit - making all the codes directly available from the keyboard. *FX227,140 and *FX228.-150 will do this (see below). Second, how to make editing in modes 0 to 6 easy. It is possible to redefine the appearance of the characters 128 to 159 in modes 0 to 6 without giving up any extra memory (&COO to &CFF have already been

f-key overlay

set aside for them). Since these are the same codes as the teletext control codes, it is possible to arrange things so that teletext control codes appear as symbols relevant to their function: eg. a small underlined R for red. The VDU statements in the program below set up such a set of characters shown on the f-key overlay.

If you intend to use these codes often the character definitions should be included in your key-define program (assuming you have one (!BOOT on disk)). The two *FX commands should be included in the *KEY10 (BREAK) definition. The character definitions may be stored on files in four ways:

1 As a Basic program 2 As a *SPOOL file of VDU statements. 3 As a *SPOOL file of the output of the VDU statements (as created by the

example). 4 As a *SAVE file of the memory from &COO to &CFF inclusive.

ERROR TRAP

I have written a pair of subroutines for 3000 and 4000 series PETs, which provide an error trapping facility. They work by storing a command in the keyboard buffer, which is executed after an error, in this case causing a jump to line 12000. The interrupt routine is disabled when the trap is enabled, to prevent the

clock, the stop key, and the cassette motor. The trap must therefore be disabled before getting data from the keyboard, or using the cassette system. The routine clears the screen when an error occurs. To enable the trap use 'GOSUB 10000', and to disable it use 'GOSUB 11000'. The routines set 'ER' to -1 when the routine is enabled, and to zero when it is disabled.

action should be to disable the trap. Although variable values are preserved, the contents of

the stack are lost, so you cannot continue a FOR-NEXT loop or subroutine. Robert Oakeshott

The Right Product at the Right Price

The TIGER is the most unique and powerful microcomputer in its price range, exceeding the capabilities of any other micro in its class.

Designed for ease of use, convenience and to a price, TIGER will perform for a one person office, small to medium size business operations, and with its versatility and flexibility, the TIGER is ideal also for the large corporate user.

Comprehensive Software, **Documentation and Support**

Look at the TIGER specification. Impressive? Yes! But, all these features count for nothing unless you have reliable software, good documentation and the right level of professional support. TIGERBYTE® software includes Peachtree - one of the world's biggest and most experienced software specialists. In addition to these basic accounting and office productivity programs, TIGERBYTE® provides proven communications and graphics software. With excellent documentation and nationwide service backup, HH provide the dealer with total product and support.

Designed for the Market

The TIGER was designed with the user in mind. Apart from its obvious aesthetically pleasing appearance and excellent use of ergonomics, the TIGER performs. The price and performance meets the

needs of the smaller business but, because of its built-in modem and immediate access to Prestel, the TIGER is a powerful communications tool. Comprehensive interfacing ports mean TIGER can support advanced data communications to other terminals, minicomputers, and large corporate mainframes. With outstanding colour graphics, the TIGER is a compelling selling proposition.

HH®-The Company

The TIGER comes from a well-established British company renowned for its high quality electronics and marketing skills. We have an impressive list of clients worldwide supported by over 600 dealers in 48 countries. We'll be here tomorrow.

The Future Today and Tomorrow

The TIGER'S design is based on a combination of some of the most advanced microprocessors available, providing significantly better performance than any other micro in its price class, so it won't be obsolete tomorrow.

Invest in the Future Today

Innovation, quality and service. That's HH. We are now looking for the best 100

dealers in Britain. That could be you. Contact HH now for a dealer pack.

MEDDLING WITH MICROTAX

Is Microtax the long-awaited solution to make light work of those formidable tax return forms? Tony Harrington discusses some of its benefits.

The first thing to be said about Microtax is that it is a serious venture. A lot of work has gone into producing it, and the initial impression is that not much has been taken for granted.

Anyone who has loaded games cassettes onto the Dragon, and that includes most Dragon owners, will know that instructions for a specific program can usually be found in the tape cassette folder. My first reaction, coming to the Dragon from disk based applications, was to look for the loading instructions in the Guide that comes with the cassette. This was a mistake.

The 'Guide', as it says on the cover, is a separate work from the program and is in no sense a reference manual for it. Although the program frequently sends the user back to the Guide, it is always for a more indepth explanation of the UK tax system, never for additional information on how to operate the program itself.

In other words, the 'Guide' is in no sense an operating manual for the program.

Microtax is somewhat handicapped in its serious aims by the fact that the Dragon has not yet worked out how one program can be loaded and automatically run from another program. Using the remote jack plug that comes with the Dragon, it should, in theory, be possible for the program itself to load the next section of the program at the appropriate time, but the user still has to type in 'run', and press enter.

The tape contains half a dozen different programs on each side. The first program consists of a number of messages on the screen to guide you through the initial familiarisation stage. I had nothing against these, as a little too much advice is better than leaving the user to flounder around alone. Incidentally, it is worth noting that Side A, at least, of the tape will not accept decimal places, so amounts have to be rounded down to the nearest pound.

Since my remote jack-plug connection didn't seem to work, it was not possible for me to test the effectiveness of the program's ability automatically to call in the next routine. It flashed a message on the screen saying it was searching for the next program, but since the tape recorder remained motionless, I figured that the message was a little optimistic.

Microtax is supplied by Tax and Financial Planning Ltd. It is designed to calculate income tax liability and tax payable for the year ended 5 April 1983, but it also assists with the completion of the 1983/84 tax return. It runs on the Dragon 32. The complete package consists of a 1982/83 UK income tax guide and a cassette containing a number of programs.

quite easy to do, but it made me long for a disk based system, with all the access facilities of disk. And it raises the question of how seriously one can take even the most efficiently designed tape-based program when it gets to this kind of size. It needs an enthusiast to go to some time and trouble doing this sort of thing. Most people, even those with a tax problem, don't want to be bothered.

Familiarisation

The introduction starts off simply enough by asking whether you have a printer to work with the program. I didn't, and was immediately advised by a neatly printed message (black on a green background) to take notes!

The 137-page Guide is long and comprehensive. Like encyclopediae, you are not expected to read all of it, just the sections the program states are relevant for your needs. This comes as something of a relief since most ordinary users will not want to plough their way through 137 pages on the intricacies of the UK tax system.

Right at the start you are warned that if you are married and both you and your husband/wife work as employees, the tape will have to be run through twice. There was no explanation as to why the program couldn't handle both simultaneously, but within the limited capabilities of 16k, processing the values for one person's income and tax was probably as much as could be expected.

Pressing 'break' on the Dragon does dreadful things to a sequence of programs like this. So although the program uses the 'press any key' technique to move you on to the next screenful of information, it is thoughtful enough to add 'press any key but

out there who would have pressed it without this warning. There is doubtless one who will press the break key even with the warning, but there is not much a program designer can do about such folk.

The other point to bear in mind is that you cannot simply sit down with this package and bang out your income tax. Before you sit down to it you need to put in a bit of work gathering the necessary documents. The program tells you as much before you get very deeply into it: 'Before commencing we suggest that you gather together as much of the information as possible as listed in Appendix A.'

You also need to establish your domicile and residence status. These delays before you begin working out your tax are inevitable if the matter is going to be treated seriously. Nobody wants to get their tax into a muddle.

Documentation

The documents you require are: your tax return, as completed last year; your present tax return; your P60 form (the one given to you by your employer showing earnings for the year, your pension contributions and your tax deductions). Then you need the P11D and the P9D, which is the form returned by your employer, giving details of 'benefits in kind' (a company car is the prime example).

Other documents you need — or might need under certain circumstances — are your assessment for the past year; details of the number of days you spent working abroad; details of building society rates paid in 1983 in respect of your house, and details of other loan interest for which you know you get relief; dividend vouchers; share transactions and contract notes; tax deduction certificates in respect of any pensions received; vouchers from building societies, banks and so forth; as well as deeds of covenants made. Armed with all these you are ready to begin.

Well, almost ready to begin. One of the problems with this kind of program is that there are so many factors which have to be taken into account. The program cannot just assume that users will know definitely one way or another whether they should in

Problems

But there is a problem. Domicile is a thorny question. As the Guide points out, this is a problem of general law, not just of tax law. If you are new to the country or uncertain about your status, it might be possible to work out your tax obligations from the notes given in section A5 of the Guide. But I wouldn't advise it. The Guide itself points out that 'it is not possible to list all the factors that are considered in determining whether a person is domiciled in a particular country'. So if you are in doubt, get expert advice.

When you have sorted that one out and are in the position to give a confident 'ves' or 'no' to the question: 'Are you domiciled in the UK, yes or no?', you reach the next murky area, namely, questions about residence.

If you have never thought about your residence or domicile status before, it probably means that you don't have to. In that case, this section of the program will strike you as a little quaint. It has to be worked through all the same, but that only takes a moment or two. The real test of the program at this point is how well it serves those who might have a problem in this area.

About the best it can hope to do is to indicate what are the problems connected with being 'resident' or 'ordinarily resident' (the two are not quite the same) in the UK. And it does this reasonably well. You can omit the residence questions altogether if you are sure (as most users will be) that you are a resident.

If you do want advice here, the first thing the program tells you is that it is not really competent to deal with residence questions. 'These residence questions (on your screen) are not exhaustive. Please read the manual where advised to do so and seek professional advice if in doubt,' it says.

But it gives a sound idea as to what would make one a non-resident. Going abroad under a full-time contract of employment which is still in force is an excellent way of being non-resident (though you might still have to settle your current tax bill first, depending on when you plan to leave).

The program also asks you whether you have been physically present in the UK for 183 days in the 82/83 tax year. An extended holiday abroad can have great implications for your tax status.

Having answered all these questions you get a comforting message up on the screen asserting 'You are resident and ordinarily resident in the UK' - and so, by implication, it will be worth your while continuing with the Microtax program.

Tax jargon

and motanice of this occurs when you begin the tax program proper, having answered all the preliminary questions. The screen asks: 'Do you have any earnings which arise from an office or employment in 82/83. See B.2.' In ordinary language, this does not make much sense. Earnings which arise from an office you might suppose to refer to earnings which you get from working in one. You'd be wrong.

Turning up the Guide you will discover that neither 'office' nor 'employment' have been defined in tax law. An office is usually referred to as 'an existing permanent substantive position which has an existence independent of the person which fills it, and which is filled in succession by successive holders'.

When you work your way through that one you might realise that earnings from an office means holding a company directorship or the like. Employment, on the other hand, arises when there is a contract of service as opposed to a contract for service. If you are paid under the PAYE system where you receive your pay net of tax. then you can be relatively certain that your earnings arise from a contract of employment.

By now it will have struck most users that they are discovering a great deal about tax law that they do not really need to know in order to fill out their income tax returns. It might have taken the more curious among them some time to reach this point in the program. And still not a line of their tax return has been filled in. One way of looking at this program -for all its seriousness is to see it as another elaborate question and answer computer game. That is why it strikes me that whatever the supplier's intentions, the program will appeal most of all to enthusiasts who want to get the feeling that they are doing something useful with their home computers.

The program goes on to ask whether your earnings are accessible as earnings under Schedule E, or as profits of a trade or profession under Schedule D. Most users who get this far on the Dragon will know from past history whether they fall under PAYE or not. If you don't know, the program won't be able to help you. It will simply bring you up short at this point.

Microtax can deal with up to five separate contracts of employment. Most people only hold one (nearly four million don't hold any, but that is beside the point since they won't be buying this package).

Having answered all the domicile and residence questions and decided that you do fall inside the PAYE NET, there is still one more barrier to cross before you start work on your tax. The program wants to know whether your employer is resident in the UK or not (the employer company,

As the Guide points out, the residence of

tax if, by some chance, your employer is not a resident UK company.

A large number of expatriates from abroad working temporarily in the UK will be put on the payroll of a non-resident company in order to reduce their tax liability. As the rest of the world has noticed, UK tax rates tend to be unusually high.

Comprehensive cover

Once through that, you are finally ready to begin. It sounds like an awful lot of work, but the program has had to foresee every

MEDDLING WITH MICROTAX

your gross pay. That is an easy one, since if you don't know that, you are going to be in a pretty poor position to work out your tax! But the naive user will stumble again once he comes across Benefits-in-Kind (sections C.1 to C5 of the Guide).

You can omit the Benefits-in-Kind section altogether, or omit it for selective contracts of employment (if you have more than one). For those who need it, it is a vital section of the program, since working out what you owe the taxman for your company car can be a real headache.

The Car Benefit program is a separate program on the tape and has to be loaded separately. Theoretically, as I've said, the program can call up the next routine automatically. This didn't work for me since I had a rather elderly tape recorder. But loading each additional program was no real problem.

This section is designed to take you through all the details that the Inland Revenue needs to know in order to assess the taxable value to you of having a company car. The questions it asks include: how many cars were available to you; whether you changed the car during the year; whether it was more than four years old; what cylinder capacity it had and the number of days it was available to you.

It also wants to know the business mileage through the year. At the end of entering all the information — and this is true of all the following sections where you enter information — you get a chance to rerun the section, without reloading the program, to change any details you want.

When you have finished, the program comes up with a pound value of the benefit to you. Where the program gets this value from is not at all obvious, as it is based on the intricacies of what the Inland Revenue has laid down. Unless you are a tax expert yourself, you will simply have to take the program on trust here.

The rest of the Benefits-in-Kind section is contained in the next program on the tape. It deals with things like free season tickets; travel vouchers; credit cards, etc, living accommodation (explained in the Guide); heating, lighting, repair bills, etc, paid on this accommodation by your employer; and so forth. Once again, gathering all this information, if it applies to you, could be tricky, but it is information you would have to supply to the taxman anyway. If it doesn't apply to you, it can be whisked through fairly quickly.

Profit sharing schemes have become more popular recently, and the Benefits-in-Kind program includes a section on these

Next comes the Expenses program. All the expenses reimbursed or paid to you have to be taken into account, and the program is at least useful in reminding you of this fact. These can include motoring, travelling, entertaining, mileage allowance, subscriptions, round sum expenses and so

market rate are also taxable expenses.

Then the program goes on to ask about things like pension contributions paid by you through the year. Most of this kind of information you could get off your P60.

This is followed by another program called Working Abroad — a question and answer session designed to see to what extent you have escaped the PAYE net by working abroad through the year. If you have or think you might have been out of the country during the periods from the 6/4/81 to 5/4/83 or will be between 6/4/83 and 5/4/84 then this is the program for you.

Then comes a section on Compensation. The number of people who will buy this program and who will receive compensation for one reason or another through the year can probably be counted on two fingers. But if you need it, it is there. The final section on Side A of the tape is a summary section which totals all the values you have input so far. It tells you a) that you are domiciled in the UK (or not); b) what your company car and benefits-in-kind are worth if you have them; and c) what your expenses are worth. Having done all this, you then have to put Side B on and only at this point are you ready to begin actually filling out your tax return!

Form filling

Side B reminds you once again of the documents you need. Then it works through a maze of questions of the sort that you will find on your tax return form anyway. For example, were you married and living with your spouse during the tax year in question? Did your husband die during the tax year? and so on. It also tells you to do helpful little things such as entering the name and address of your employer on your tax form.

You would have done all this anyway without the program, but since part of its function is to tell you how to fill in your tax form these little prompts could hardly be left out. I found them pretty pointless, but there might be those who find them helpful. Remember, the tax form itself tells you to fill in this kind of information.

The next five sections in the program, headed Return 1 — 5, work through each of the sections of the tax return form, telling you to put in crosses, values and so forth.

Some of these sections are more com-

plicated than others — for example, entering the total value of life assurance premiums paid by yourself through the year is fairly simple; working out the tax due on rents from furnished or unfurnished property, on dividend payments and so on, is not. Once again, you are free to move quickly through the sections that do not interest you.

I was reasonably convinced that all the things that one would normally be caught out by in completing a tax form were included in the program. This includes everything from building society interests, to alimony payments, to supporting a permanently disabled child who has passed the home leaving age.

Return No 5 adds up all the information that you have put in on Sides A and B and lists everything. It also lists the personal allowances (£2445 as the married man's allowance).

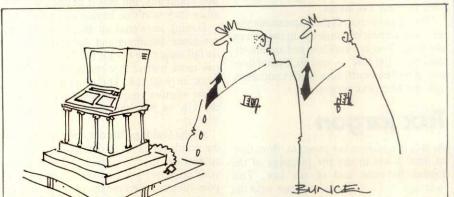

The last program deals with the computation of your tax. At this point you are finally in a position to receive all those good things that Microtax promises you on the cover wrapping. It does a little calculation to see whether you would be better off as a married couple electing for separate assessments. It also tells you whether you have overpaid your tax.

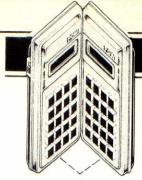

Conclusions

My feeling as I came to the end of the program was one of immense relief. If I had been using it to fill in a tax return, instead of simply reviewing it, I would have switched it off shortly after starting. But then, in my days as an employee, not having too much by way of dividend income or benefits-in-kind, and not having any handicapped relatives to support, fillling in my tax return was always a rather simple business.

The program will be helpful, though, to the employee with all sorts of factors to take into account. (Microtax has promised that a program designed to meet the needs of the self-employed will be out shortly.)

So if you live in a house provided by the company, pay a minimum rent, have a company car and are blind, receive income from earnings abroad, have a profit sharing scheme and a couple of thousand shares in various companies, then this is the package for you. Alternatively, you might buy it for the joy of running a program that actually relates to the real world instead of to some programmer's fevered dreams of alien invaders.

PORTABLE COMPUTER WORLD

SHARPER DEFINITIONS

Amanda Parfitt takes a closer PEEK at the Sharp PC 1500

The Sharp PC 1500 has six function keys referred to as F1 to F6 which the user can define in the RESERVE mode. These may be set for frequently used keywords or statements. By use of a selection key, each function key can represent three separate statements, the level of key selection being indicated by a I, II or III flag at the top of the display. Associated with each of the three levels of function key definition is a descriptor of up to 26 characters which can serve as a reminder of the purpose of the six keys at that level. The user has only to press the RCL key to be reminded of these definitions.

The definition of these keys may need to be changed to suit a particular program, but unfortunately these definitions are not passed to cassette by the CSAVE command. Consequently, the poor user has to spend several minutes manually redefining these keys after loading the new program.

The description below not only shows how you can incorporate function key definition into your programs, but also illustrates the procedure with a general purpose program which can be tailored to your needs.

The key to the problem lies in the 188 bytes that the machine uses for storing the three reminders (each up to 26 characters) and the 18 definitions. These bytes are described in Fig 1. In order that each of the 18 statements or keywords can be distinguished, a start byte is associated with each definition. On pressing a function key its reference byte is compared with each byte in the definition space (14422-14531) until the correct start byte is found. Then the succeeding bytes are brought into the keyboard buffer until a different start byte is reached. Fig 2 describes the values of these start bytes. For those of you with orderly minds the level II and III values do look as though they have been switched. This definition space is filled in the order that key functions are defined, so that start bytes may not appear in the order shown in Fig 2.

To put all this information to use, one has simply to do a little judicious POKEing within the particular program and thus define the function keys. There are many ways of doing this depending on the application. Fig 3 shows a general purpose program which should be CSAVEd as it is but adjusted once CLOADed for particular applications

CLOADed for particular applications.

values have been assigned to both of these arrays up to the maximum capacity allowed for each. Using the editing facilities of the PC 1500 on these assignment lines one can replace the dummy values by those required for your application.

The small letter 1 in each of the three strings of A\$ divides the 26 character display into the appropriate areas for F1 to F6 so that the reminders appear over the relevant function keys. If you are not quite with me at this stage RUN the program as it is and press the RCL key to see what I mean.

When putting values into B\$ you must ensure that the first character of B\$(0) is a colon: and then use other colons to separate the functions or statements that you are defining. B\$(1) is a continuation of the first string B\$(0), so do not worry if you are only halfway through a definition at the end of B\$(0). The functions should be entered in the order F1 to F6 for level I, II and then III ending with F6 level III. Remember that you only have enough space for your definitions as there are dummy variables. If you run out of space look carefully at the functions or statements that you are defining and see if these can be abbreviated, for example, R is the short form of RUN.

This simple routine can be part of a larger program and hence will be passed on by CSAVE as required. There are other uses for these 188 bytes of course, perhaps as additional protected memory space.

YANKEE DOODLES

Random rumours

Rumours persist that IBM will soon announce its 'peanut' 16bit portable computer, with flat panel display, 64 or 128k of RAM and an expected price between \$700-900. The unit is expected to be offered to mass merchandisers. . . IBM is said to be studying the possibility of adding the Pick operating system to its repertoire of operating systems for the PC... Microsoft is reportedly close to releasing its word processor package and is beta testing a user shell for its MS-DOS to integrate its Multiplan and word processor packages in much the same manner as Lotus 123 and VisiOn. . . In the meantime rumour has it that VisiOn deliveries have been pushed back to August/September.

Random news bits

Microsoft has introduced a \$195 mouse device (made in Japan) with demo software. . . CBS has formed a division to publish personal computer software. . . Bill Synes, the chief designer of the IBM PC and an 18-year IBM veteran. has left IBM to join Franklin Computer (an Apple lookalike maker)... Cannon Inc, Tokyo, a major supplier of calculators to the US, will shortly begin shipping personal computers. . . California Software Products Inc., Santa Ana, CA, has released a package that enables the PC to run IBM System/34 applications soft-without modification. They call it 'Baby/34'.

Bia blue report

Sol Libes presents his monthly batch of juicy snippets from the Big Apple.

by giving its own direct sales force greater latitude. Discounts offered by IBM salespeople have been increased and they are now being permitted to accept orders on individual units (previously they were limited to accepting orders for 20 or more units). IBM itself is offering discounts of five per cent on 3-10 machines, eight per cent on 11-19, 12 per cent on 20-49, 16 per cent on 50-149 and 20 per cent on 150-249 units. IBM now has 770 dealers including 40 IBM product centers, 45 Sears Business Centers, 330 Computerland outlets, 350 independent retailers and nine value-added dealers.

Microsoft to offer Xenix via retailers

Xenix, the Microsoft implementation of Unix disk operating systems for microcomputers has until now only been available as a product bundled with a hardware system. Microsoft will now be selling a simplified version through computer stores. Initially a version for the Apple Lisa will be offered to be followed with an IBM PC version. It will include a hardware card which must be installed into the machine.

Commodore shipping new computers

Commodore has made initial shipments of three new micros to dealers: the B500, C128 and PET 64. Two more machines - the trans-portable SX100 and a Z8000-based 16-bit Lisa-like system — are expected within 90 days. The SX100 is expected to have a 5in screen and retail for under \$1000. A \$1500 colour version is expected to follow. The Z8000 machine is expected to sell for less than \$3000 and will include monitor and 896k

of RAM.

ports full colour and is expandable to 896k of RAM. It is the first Commodore machine with a true RS232 port. The B500 (at \$895) is an 80column black and white business oriented version of the C128. An Intel 8088 plug-in board with MS-DOS and CP/ M-86 is expected as an option. The PET 64 is designed for educational use and will sell for \$695.

Two more business-oriented machines (B700 and BX700) are expected later. The BX700 is expected to have three processors: the 6509. Z80 and 8088, with the ability to switch back and forth between them. Also expected is a machine to be called the 'Executive 64' which will include 128k of RAM and bundled software.

Electronic software delivery

As if computer stores were not having enough competition in selling software from bookstores, they are now getting competition from radio, cable and timesharing companies. These companies have introduced electronic delivery of software (currently mostly games). PlayCable, a joint venture of Mattel Inc and General Instrument Corp, is currently sending video game software to cable TV subscribers in three cities. National Public Radio has received permission from the Federal Communications Commission to broadcast software in an unused portion of the FM radio band. And CompuServe Inc, a timesharing service for personal computer users, has initiated a service whereby users can download software and have it billed to their charge card.

Notebook portables arrive

The true portable computer market is off to a fast start with notebook-sized products Candy Encon and NE

shortly as is Commodore, Osborne and Apple. Commodore, which announced the HHC-4 hand-held computer back in Janaury has announced that it has cancelled the project. The unit was to have had a 24 character LCD display and other features now considered too limiting in this new emerging market.

Tandy is expected to be the front-runner in this market for this year. Tandy expects to sell 100,000 portables (100 million dollars worth) this year alone. NEC, with a unit very similar to the Tandy unit, is expected to be second with Epson third. Epson is expected to introduce a new Z-80 based unit with 80-column display this summer to replace their current unit. Prices should start dropping by Christmas.

The portable computer market appears to be the first segment of the personal computer market in which the Japanese will assume a prominent position.

Home computers a marketing game

The home computer market is behaving in a manner akin to the calculator field of the early 70s with prices dropping monthly. Home computers are no longer being sold by independent computer stores but rather are the staple of mass merchandisers and catalog sales organisations. The thing that is expected to save computer makers from pricing themselves out of business is the aftermarket for products such as peripherals and software.

Timex/Sinclair, Texas Instruments and Commodore are in a neck-and-neck price race, with Atari running a close fourth. The Timex 1000 (Sinclair ZX81) can now be purchased on sale for under \$40, the VIC 20 for under \$85 and the Atari 400 for under \$100. And there are rumours that we may see the

YANKEE DOODLES

The Commodore 64 is currently selling for as low as \$288 (including a \$100 rebate), which is half of what it was selling for last September. The Atari 800 is now selling for \$388 (with a \$100 rebate).

Atari is going through a reorganisation, moving manufacturing to the Far East to reduce cost and going into the chip manufacturing business to integrate vertically in an attempt to remain in the race. Tandy, despite the selling of over 300,000 colour computers, is now a distant fifth in the field and will most likely drop further back as game makers such as Mattel and Coleco step up their marketing efforts.

One drop-out already is the decision of TI to drop its new 99/2 computer, after test marketing the unit for under \$100. The basic problem is that the current 99/4 computer is now selling for under \$100.

The desk-top microcomputer market has also been the scene of price slashing. In response to IBM's 15 per cent decrease in the price of the PC, Apple cut 20 per cent from the Apple III, Texas Instruments cut 15 per cent from its Professional, Xerox

cut the price of the 820-II by 26 per cent and Zenith cut its Z-100 price by 12 per cent.

Book publishers move into computer book publishing

Doubleday, one of the largest book publishers in the country, recently gave an author a \$1.3 million advance (a new record) on a book to be titled The Whole Software Catalog. Virtually every major book publisher now has a computer book division and computer books are staples in almost every book store. Several of the book publishers have also begun software publishing operations as more and more book stores have begun to carry software on their shelves.

Zilog to release

Zilog has finally officially

released the Z800 microprocessor, although samples will not be available until the fall. Production is expected in the first quarter of 1984. The Z800 is a greatly enhanced Z80 — Zilog claims five times greater performance. The Z800 will include a memory manager (for up to 16 Mbytes), DMA controller. counter/timers, serial I/O, 256 byte cache memory, interrupt controller, four additional addressing modes, four additional registers (including a second stack pointer) and memory refresh logic. It has a clock rate of 10-25 Mhz (Z80 current maximum is 8 Mhz).

The added functions include instructions for hardware multiply/divide, 16-bit arithmetic, 16-bit load, system/user calls (for multiuser/multitasking) and test/set (for multiprocessing). A floating point math coprocessor (Z8070) was also announced. The Z800 will come in four versions (see below).

The 8-bit I/O versions interface directly with Z80 peripheral chips while the 16bit I/O versions work with Z8000 family of devices and have about twice the throughput. The 40 pin devices will omit circuitry such as serial I/O and DMA controller.

FCC fines microcomputer makers

Forty four manufacturers of personal computers and electronic games have been notified by the Federal Communications Commission that their equipment does not comply with FCC standards on radio frequency interference (RFI). Of 317 devices checked, the FCC found that almost 30 per cent were in violation.

ROSS-FIGURI

For those among you who were unable to come up with all the answers for our Cross Figures Puzzles last month, here are the solutions.

Solution 'Cross Solution figure puzzles' 'Theatre' clue

1	8	2
0		8
7	4	9

The clue for A-down is redundant.

[^] 5	6	*7
2		7
9	8	7

All four clues are needed.

3	6	1
2		9

The year was 1576 (see library ref. books!). A-ac must be between 1000 and 1999. So C-dn (twice A-ac) must be between 2000 and 3998, ie, C-dn begins with 2 or 3. But 1st digit of C-dn is also last digit of A-ac, and Cdn is twice A-ac, so twice that digit must give a 6 for the last digit of C-dn: $2 \times 2 = 4$ no; $2 \times 3 = 6$. OK! So first digit of C-dn is 3, and C-dn is between 3000 and 3999.

So A-ac (half of C-dn) must be at least 1500, ie, 2nd digit of

dn must be same as 1st digit of D-ac. Now some calculator work...Set 55 in calculator as first trial value of B-dn. Try values of D-ac starting at 15:

D-ac * 5 xB-dn * 5-9 5 A-dn 1 * * 5

 $55 \times 15 = 825$ too small $55 \times 25 = 1375$ $55 \times 35 = 1925$ no no $55 \times 45 = 2475$ too big — try 65 $65 \times 15 = 975$ too small $65 \times 25 = 1625$ no $65 \times 35 = 2275$ too big — try 75 $75 \times 15 = 1125$ yes! But check

 $75 \times 25 = 1875$ $75 \times 35 = 2625$

values: no too big. Try 85 and 95: no, no.

So only one possibility: 75 x 15 = 1125

The digits of A-ac total 19. We have 1, 7 and 3, adding up to 11. So remaining digit must be 8, giving A-ac as 1783. So Cdn (twice 1783) is 3566. That gives 76 for E-ac, and the square of 76 is 5776, giving Fac. And that's it!

1	7	8	3
1	5		5
2		7	6
5	7	7	6

To find solution without knowing the actual 'theatre year' (the first digit must be 1, of course!), you need a list of squares (from calculator or maths table) and determination! Clue for A-ac is important. Happy hunting.

Solution Common factor

Three out of every four computers going into schools are BBC Micros. Is there a lesson to be learned by every user?

As part of the current government subsidised scheme aimed at introducing micros to schools, the Department of Industry undertook a survey of machines available and made recommendations to education authorities all over the country.

The BBC Micro met their priorities exactly: it is economical yet fast and powerful, and it can justify the investment involved, through its capability to grow with the needs of the user and with the rapid changes in technology.

Teachers and education authorities agreed, and today it represents over three-quarters of all micros being ordered for schools across the country under the DOI scheme.

The BBC's choice too.

In choosing a machine to put their name to for their massive Computer Literacy Project, the BBC had the same set of priorities as the DOI. The BBC Micro is now an integral part of that project, which includes books, software, courses and a number of major television series, one of which, "Making the Most of the Micro" is now being broadcast.

All this for only £399.

The BBC Micro is light and compact. It generates high resolution colour graphics, and is capable of synthesising music and speech using its own internal speaker. The keyboard uses a

Model B) is available for only £399. (There is also a basic model available, the Model A, at £299.)

Designed to grow.

Last year the magazine "Which Micro?" said that the most attractive and exciting feature of the BBC Microcomputer was its 'enormous potential for expansion'.

This is indeed one of the features that sets it aside from

the competition.

For example, as well as interface sockets to allow you to connect to a cassette recorder, and to your own television, you can also use video monitors, disc drives, printers (dot matrix and daisy wheel) and paddles for games or laboratory

You can also plug in ROM cartridges containing games with specialist application programs.

The Tube. A unique feature.

The Tube, which is unique to the BBC Micro, provides for the addition of a second processor via

3MHz 6502 processor with 64K of RAM doubles processing speed. While a Z80 with 64K of RAM opens the door to a fully CP/M* compatible operating system, with all the benefits for business applications.

<u>Linking up with other computers.</u> The BBC Micro also offers a facility of immense potential value to schools, colleges and businesses. It's called Econet - a system which uses telephone cable to link with other BBC Micros. Anumber of machines can then share the use of expensive disc drive and printer facilities.

Make full use of Prestel & Teletext. With special adaptors you will not only be able to turn your TV set into a Prestel terminal and Teletext receiver, but you can also take data and programs direct from these services. (The programs, which are known as telesoftware, are already being broadcast by BBC's Ceefax service.) This is another first for the BBC Micro.

BASIC plus. A sophisticated version of BASIC has been chosen for the BBC Micro, which incorporates features normally found only in more advanced high level languages. However, there is also a facility allowing access through a simple command to another language - for example, PASCAL, FERTH and LISP.

*Trademark of Digital Research.

A full range of software. Applications software for the BBC Micro already cover a very wide field. Packages covering games, education and business applications are

The best possible back-up.

Your BBC Micro comes with the backing of the BBC and an extensive dealer and service network.

Each approved dealer is able to offer advice and carry out expansion work and repairs.

BBC Microcomputer - Model A and Model B.

2MHz 6502A Processor.

32K ROM; 16K RAM Model A, 32K RAM Model B.

Full QWERTY keyboard with 10 user-definable function keys.

Mixed high resolution graphics and upper and lower case text.

300 baud and 1200 baud interface for standard cassette recorders.

Three-voice music synthesis with full envelope control feeding internal loudspeaker.

Interface sockets (Model B only) - RS423, for analog inputs centronics and user port.

6502, Z80, 16032 second processors.

Single and Dual Disc Drives with 100 and 800 K-bytes storage.

Teletext unit.

Speech synthesis.

Networking facility - via Acorn Econet.®

How to buy your BBC Micro.

If you are a credit card holder and would like to buy a BBC Micro B, or if you would like the address of your nearest stockist, just phone 01-200 0200.

Alternatively, you can buy a Model B directly by sending off the order form below to: BBC Microcomputers, c/o Vector Marketing, Denington Estate, Wellingborough, Northants, NN8 2RL.

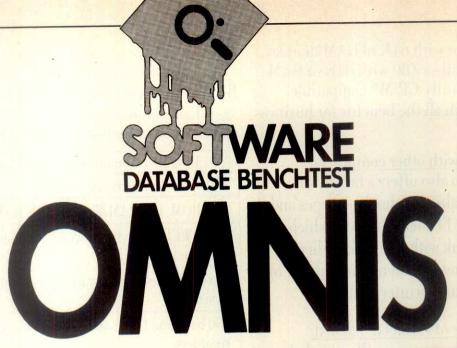

All orders are despatched by fully insured courier and come complete with easy to follow 500 page User Guide and Welcome cassette.

A universal data management package? Kathy Lang determines whether OMNIS lives up to expectations.

In this series so far, the great majority of systems reviewed have been for the CP/M and MS-DOS operating systems, which are very commonly available, and similar to one another to the point where MS-DOS disks can convert files from CP/M formats. This month the subject is a data management system which runs under UCSD-p the Pascal operating system which claims to be the most portable of all. Certainly OMNIS runs on a very wide variety of systems, from Apple II through Z-80 based systems such as SuperBrain and Osborne to 16-bit systems like Sirius, IBM PC, DEC and SAGE II. In each case it uses the 'native' processor so that you don't need to install a Z-80 card to run the system. Here I shall be looking at how such a system, which almost any disk-based micro can use, compares with others which are more system specific.

OMNIS records are of fixed structure and length; the first field in each record must be a key field, and up to nine others may also be indexed. These indexes are all kept up-to-date. File structures can be changed only by copying the file out to a plain text format and back into OMNIS again. You cannot link one data file directly to another. Any record or group of records can be retrieved either via indexed key fields, or (more slowly) by selecting records which match criteria based on any fields. The package uses menus to get down to the level at which the user's records are displayed on the screen. When processing individual records, commands are used, but you can ask for a list of those available to be displayed on the screen. Quite extensive security facilities are provided to ensure that users have access only to appropriate parts of the system, and to the information which the Master user thinks they need.

Constraints

The main constraints on the use of OMNIS are shown in Fig 1. The most significant for many applications is the restriction to a maximum of 79 characters in a text field that is, each field must fit within a single line of an 80-column screen. On the plus side, you need not have all your data on a single screen — fields of a records may span up to ten screens in record insertion and amendment operations.

File creation

The first stage in file creation is to set up formats for one or more screens on which to enter records. To do this, you locate the cursor in the position where you want the field label to begin, type the label, and position the cursor where you want the field contents display to start. You then press an ESCape sequence to go into command mode to give details of the field. The first is the name by which the field is to be known to OMNIS (not necessarily the same as the 'label' displayed on the screen, as the OMNIS name is restricted to seven charac-

ters). You can include the same named field several times - for instance, a reference number once on each screen for applications where a record spans several screens. (That invaluable facility is not documented in the present manual, and can therefore provide an unnerving surprise if you type an existing name by mistake.) Other attributes to be supplied include the length and type of the field, whether it is to be indexed or not, and some additional optional characteristics such as the permitted range of values (which can include 'wild' codes), the precision of display of numeric fields, and, for calculated fields, the nature of the calculation to be performed. There is no provision for echoing, for instance, the value of the same field in the preceding record. When a field has been set up, the screen shows its position so that there is no danger of field overlap. Field sizes and types may be amended at any time before the file contains real records.

Once complete, the format is stored and the user is invited to give the maximum number of records the file will contain, so that sufficient disk space can be allocated. This took six minutes for a 1200-record file on a single Sirius disk. The space can be allocated on one or more disks. The OMNIS/UCSD-p volume assignments seem to use the Apple conventions. Being unused to these I found this part of the package a little confusing, but managed to set up the file for my Benchtest data correctly by carefully re-reading the manual.

Once a file structure has been set up, and records stored in it, it cannot be altered within OMNIS - not even to the extent of changing the fields to be used as keys. Nor can you decide that you need more records than you originally expected. (The details of screen display can, however, be altered see below.) If you need to change field lengths, add extra fields, define more or different key fields for indexing, or increase the maximum number of records allowed, you must write the file out to a plain text file in DIF™ format (see below, under 'Links with Outside'), redefine the file format, and hook into OMNIS This is

this inflexibility over changing record structures, but few take it to the point of restricting changes to key field definitions, or to the maximum number of records, to such a procedure.

Data input and updating

Record insertion and amendment is carried out via the maintenance function on the main menu. Once this function has been requested, you have a number of commands available, including 'I' for insert a record, and 'E' for edit (the current) record. The commands are activated by pressing the ESC key - once or twice, depending on your system - followed by the command letter. To retrieve a record for editing, you can specify the value of any of the key fields. The procedure is to issue the 'find' command, which results in a screen display of the record in the format set up at creation time, with the cursor on the first field. By pressing the RETURN key, the cursor is moved from one key field to the next until the desired field is reached, when the data to be matched is entered. Once the field value is entered, pressing RETURN again instructs OMNIS to search for the nearest match. Alternatively, pressing CTRL/N will request an exact match. I found this an acceptable compromise method of retrieval, and quite quick to use (see Fig 2 for times). Records can also be retrieved for editing with the 'select' command, about which I shall say more later.

Once a record has been found and displayed, you can either issue the 'edit' command, or ask for the 'next' in sequence (of the field used to select the record for display). So you can scroll forward through records with identical values for the key field. You can't, however, scroll backwards. Data editing is carried out by direct screen editing, using the cursor movement keys in the usual way. Deletion involves pressing CTRL/D once for each character to be inserted, and then typing in the insertion over the spaces. You can also move backwards and forwards among the screens of data for one particular record, using commands. Since records are stored to the file after being added or edited, the indexes which give access through the key fields are automatically kept up-to-date.

Displaying data on the screen

The screen formats set up when the file is created are always used to display records when accessed by the 'find' or 'select' commands. Screen display can include not only the data items themselves — which incidentally may be shown left or right justified or centred within the space for the field — but also features such as lines drawn to make the display more readable. The screen format creation section includes some commands to make this an easy fea-

characters. In addition, the order in which fields are displayed need not be the same as their order in the stored record, so although the first field in the record must be a key field, it does not have to be displayed as the first field on the screen.

The restriction to a single overall display format for 'find' and 'select' access means that you cannot vary the way the data is displayed for editing according to the needs of different applications. You can, however, restrict the display so that particular fields are not shown if you don't want the user to have access to them. So it is possible, for instance, to permit a clerk to update staff names and addresses without also permitting that person to see, still less change, staff salaries. It is also possible to display data in a variety of different formats if the need is for viewing only, and no changes or updates are required. This is achieved by the 'report' function, as any report may be shown on the screen instead of being printed. So if you simply wanted to view a few fields from selected records on the screen together, listing them one line at a time, you would have to set up a report format for that function.

OMNIS also has two features which permit repetitive amendment. A group of records meeting certain criteria can be deleted 'at a stroke' with the 'zap' command. A group of records can also be amended by the 'multiple update' command, allowing such useful actions as increasing all prices by five per cent, or upgrading salaries for all individuals in a particular staff grade by £500. The criteria for selecting records to be deleted or amended are set up in the same way as criteria for use by the 'search' command, described later under 'Selection'. The calculation facilities in 'multiple update' are the same as those permitted during data entry, which are described later under 'Calculation'.

Printed reports

The provisions for printed reports in OMNIS are extremely powerful, but quite complex in their use and explanation. The format itself is designed in a very similar fashion to the screen display format, using a mainly 'paint-a-screen' approach which I personally find quite helpful. But the way in which sections of the report are specified is less easy to understand. Each report may have up to 12 sections — one detail section. a heading and a totals section, and up to nine sub-totals sections deriving their values from fields specified as sort fields. Instead of some form of labelling of these sections on the report, they are separated from one another by a single exclamation mark, so that only be counting can one identify (when designing the format) the detail, total and other sections. Any field for which a sub-total is calculated may, if desired, force a page-break when its value

In addition to field values from the record, any section can include calculated values — up to 120 variables may be defined, calculated from field values and/or

formats can subsequently be modified (but I couldn't find a way within OMNIS to keep a previous version of a format and also use it as a basis for constructing a new stored format). The formatting of the 'detail' section is sufficiently flexible to allow inclusion of enough text to write personalised letters including OMNIS information. This is a big advantage, and not very commonly found in data management systems. However, don't expect full-blown word processing capability — for instance, you can specify that a field in a letter is to be of varying length, so that the rest of the line is moved over to close up the gap, but remaining lines stay in place rather than the whole of the rest of the paragraph being moved up in WordStar/Mail-Merge fashion.

The paper layout is specified by a separate menu option, so that you can control numbers of lines on the paper, margins and line spacing. You can also vary the number of records printed across the page, to permit the printing of mail labels which may be 'two-up' or more (up to six in OMNIS). If you only want totals printed, you can at this stage suppress the printing of the detail line. You can also specify pausing at the end of a page, in case it is necessary to print a report on single sheets rather than on continuous stationery. If the report is displayed on the screen, OMNIS pauses at the end of each screenful of information.

In addition to formatted reports, it is also possible to 'dump' a copy of the screen to the printer while editing.

Selection

For screen display, records may be selected either by the 'find' command which I talked about before, or by the 'select' command. This allows you to set up to ten criteria, which will be tested to see if a record meets the search requirements. The setting up process involves filling in up to ten lines of a form displayed on a separate screen, rather than by building up a single combined command. Fields may be tested for equality, less than, greater than, not equal, starting with or containing a constant value. (Matching against another value in the same or another record is not permitted.) If more than one test is employed, the results are 'ANDed' together, so that a record only passes the test if it meets all the criteria — this is to a large extent a consequence of the method used to set up searches. Searches may be executed immediately, or stored in a file for subsequent retrieval. Once a record has been retrieved through the 'search' command, it can be edited just as if it had been retrieved with 'find'.

Stored searches set up through the 'search' command may be used to control the retrieval of records for printed reports; this may be tied to the report format if a report always involves a particular selection, or activated dynamically when the report is invoked.

Sorting

OMNIS

browse forward through the data, the file will appear to be sorted in the order of the field used for retrieval. To get records sorted in order using more detailed sequencing, you must use the 'sort' facility within the 'report' function. This allows sorting on up to nine fields, each of which may be in ascending or descending order. Once sorted, records can be displayed either on the screen or on the printer as described in the 'report' section above.

Calculation

At input and during multiple updating, you can specify calculations based on constants or field values, combined with the conventional arithmetic operators. No memory variables are available for storing intermediate results, but at the expense of disk space you could allow an extra field or two in the record itself for this. The number of data fields allowed is quite generous. Order of execution of arithmetic statements may be modified by using brackets, which can be nested up to five levels deep. During the preparation of reports, up to 120 calculation fields may be defined, using the same features. These calculation features are relatively powerful, and should, with the provisions for totalling and sub-totalling, cater for most needs.

Multiple files

OMNIS can handle only one file at a time. However, communication between two files can be achieved through converting to DIF™ format and writing out again — see 'Links with Outside'.

Tailoring

Within its own provisions, OMNIS is a flexible package, and it permits the storage of search sequences and of report formats (including sorting and selection criteria) for subsequent use or modification. But it doesn't provide the ability to set up a sequence of operations which combine the use of several commands in a predefined sequence, to permit full tailoring to a particular application.

Security

Protection against ill-considered or unauthorised use of OMNIS is provided in a variety of ways. When the screen format for data entry is set up, fields may be protected; a record which contains one or more protected fields may not be deleted in normal operations. This provision applies to any user. An extensive set of facilities control the extent to which individual users or classes of user (four 'users' plus the Master ways and identified to the system by a

fields within records. Control may be very detailed, but the principle is that users can be given full access, allowed to modify and add data but not amend or create file structures. They can be permitted just to see records but not change them. Control over access to individual fields could be particularly useful in environments, such as hospitals or personnel offices, where information tends to be a mixture of the public and the confidential.

Housekeeping

Access to the housekeeping facilities of UCSD-p is included within OMNIS, so that by using an option given when the system is started, you can copy, delete or rename files. You can't at the moment format disks in this way, although by the time you read this article, OMNIS should include a formatting facility.

Links with outside

The link between OMNIS and the outside world is provided by the ability to read and write files in DIF™ format. This is a format deviced by Software Arts to allow exchange of data in plain text form between packages. In the full form as used by OMNIS it includes the specification of field names, which makes it possible to use the format to bring back into OMNIS a file whose format needs to be modified, for isntance by the addition or deleteion of fields or by defining different key fields. It is relatively easy, if rather tedious, to create records in the DIF™ format in most programming languages. In addition, a number of other packages, notably VisiCalc, can read files in DIF™ format. The processing of DIF™ files within OMNIS is, however, extremely slow. I stopped my Benchtest 6, which usually imports 1000 records from an external file (DIF™ format in this case) after 800 records and 2 hours 45 minutes of continuous disk activity, to save further wear on my disks. I didn't carry out Benchtest 1, which involves adding one new data field to each record, as this would have taken the time to write a DIF™ file out from OMNIS, plus at least the time for Benchtest 6 to read the records back into OMNIS using the new record format.

Whether this slowness is a serious problem depends very much on your application.

User image of the software

As is so often the case, OMNIS is a mixture of good and bad in its ease of use. The blend of menus and commands is sensible. It uses menus to get down to the record handling level, and then commands to handle the individual records. The ability to show available commands on the screen on request is very valuable. On the other hand, I thought the menu arrangement unimaginative: in particular, all the record handling - insertion, amendment, selection for screen display - is covered by one main menu option called 'Maintenance', so that you would almost always have to call up the next level of menu to carry out the most frequently used operations. And the report formats were extremely complex to set up, although less difficult in practice than the current manual makes it seem. In particular, the method of numbering the fields on the screen, and the instructions for displaying sub-totals, were in my view very confusing. The report facilities do include the ability to test the format before live printing, a very valuable but necessary

The users of OMNIS to whom I spoke were very happy with the package — one went so far as to say 'I don't know what we'd do without it'. The ability to span several screens, the power of the calculations, and the flexibility of reporting were features which were particularly mentioned.

Documentation and support

The documentation for my review system consisted of an A5-sized manual, which is in two parts: a tutorial section and a reference section. There is no summary of reference material — including commands — nor is there an index. So although the manual is much smaller and less intimidating than most, it is quite difficult to find exactly what you need to know. I also found the style rather dense and a bit sententious,

		THE REAL PROPERTY OF THE PARTY
BM1 BM2 BM3	Time to add 50 records interactively	NT — see text 2 sec/record NT — only via
DIVIS		DIF™ file
BM4	Time to access 50 records from 800 sequentially selecting on one field	
BM5	Time to access 50 records from 800 by index on 25-character field	4 mins 35 secs + scrolling
BM6	Time to index 800 records on 25-character field	NA — updated
BM7	Time to sort 800 records on 5-character field	22 mins 25 secs
BM8	Time to calculate on 1 field per record and store result in record	25 mins 10 secs
BM9	Time to total 3 fields over 800 records	26 mins 15 secs
BM10	Time to import a file of 800 records	2 hours 45 mins

Notes: NT=Not Tested NA=Not Applicable — indexes kept up-to-date, new index fields not allowed

Sage for those who demand more and more and more...

If your application is too demanding for small-fry microcomputers, if it looks as though only a mainframe will do – think SAGE and save money.

If your BOS accounting system is too much for your IBM Series I or DEC PDP 11/34, think SAGE and get more power at less cost.

: Mathematics - University of Belgrade

SAGE is simply the most powerful microcomputer — nearly 2½ times as fast as a PDP 11/34 — minicomputer running Microcobol bench tests. *Its 32 — bit Motorola 68000 processor runs at 8 MHz and executes 2 million instructions per second. It can address up to 16 million bytes of memory. It runs four poperating systems — BOS, Mirage, P System and CP/M 68 — with the Unix-like IDRIS due shortly. You can program in Pascal, Basic, Cobol, Forth, Fortran 77, APL, OCCAM, Expert, Modulla II and "C".

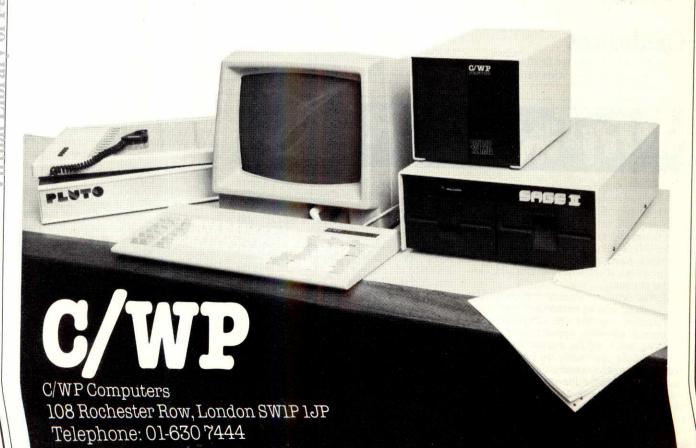

C/WP Computers, Britain's leading microcomputer dealer, now offers SAGE systems with full technical support. C/WP can supply you with terminals, printers, Winchester disks, tape drives, graphics devices, network multiplexors and communications equipment for your SAGE. All SAGE systems are covered by a free 12 months, on-site 24-hour callout maintenance service. Free delivery in the UK within 20 days of order.

SAGE II, 128k RAM, two 640k floppy drives, one terminal (two may be fitted) £3,990

SAGE IV, 1024k RAM, one 640k floppy drive, 10 Mbyte Winchester drive, six terminals £9,365

For full details and price list write or telephone C/WP Computers, Ol $630\,7444$

*Tested by MicroProducts Software Ltd using SAGE II

OMNIS

and the structure (with the chapter numbering continuous through both tutorial and reference sections) confusing. On the other hand, the tutorial section does give page numbers for the reference section showing where further information is to be found. The manual included all the major features of OMNIS itself, with some minor omissions. But I was sorry that it lacked a description of the DIF™ format, to ease the problems of people trying to get information into OMNIS from other packages, or out to other processing programs.

The disks as distributed include some example data files, which are very valuable for trying out the system to start with. Not all the examples in the manual had been tried out on the sample data, though. The example given of selecting a field from the same data file used in the manual specifies a search for which there are no matches in the sample file. . . It is to be hoped that this and other deficiencies will be remedied by the revised version of the manual, which I am told includes a complete rewrite of the tutorial section, and which Blyth Computers Ltd (suppliers of OMNIS) says should be available by the time you read this. But, as with any other package, you should make a point of looking carefully at the manual before buying.

Support for OMNIS is provided both by dealers and by Blyth direct, which has a support person working full-time on a 'hot line' for dealers and registered users. Customers speak well of Blyth's support — 'Blyth has been extremely helpful,' was a typical comment.

Conclusions

OMNIS is a powerful and flexible package, which is available on a wide variety of sys-

tems under UCSD-p, and is well-liked by its users. It can cope with quite large records, and its files can span more than one floppy disk. The calculation features are good. Its retrieval facilities are less flexible than some - the ability to combine selections only with AND would be a disadvantage to many - and it can cope with only one file at a time. The reporting is extremely powerful, but some of its features are not very easy to use. This is in contrast to the rest of the package, where by and large the mixture of menus, commands and direct screen entry using cursor movement was quite successful. If the other software you are using is not running under UCSD-

p, you would be limited to translating files across disk formats using the UCSD-p Xenophile utility.

The package is competitively priced, but its performance, as shown by my benchmark (Fig 2), is not particularly fast relative to other packages I've tested, except when retrieving records directly by key. In summary, OMNIS is well worth looking at for handling information with a fixed structure, especially if you are looking for a package running under UCSD-p. But make sure you take a good look at the manual, and see the package working on a size of file comparable with those you will be using.

Summary

Package Type Facilities

Data management: single file, fixed length records. Selection, ordering by indexes kept up-to-date automatically, powerful calculation in records and reports, good reporting, important export of files in DIF™ format, password protection on functions and fields, 'paint-a-screen' formats for screen display and printed reports. Changes to structure and max number records only by copying records out and back. Good, with exception of reporting.

Ease of Use Error messages Documentation

Clear when provided — some non-vital omissions.

Not very clear, sententious, some omissions, no index or

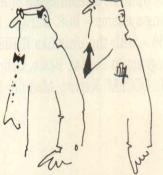

reference summary. Being rewritten.

Costs (ex VAT)

Supplier

£195 for Apple II; £295 for Sirius, IBM PC single-user systems; includes 'hot-line' telephone support. Updates £15 per release. Special prices for networked systems.

Blyth Computers Ltd, Suffolk. Tel: (050270) 371.

It's on loan from the printer company until the new models come in.

PCW welcomes approaches from would-be writers, even those who have never appeared in print before. In this game it's often those with practical experience who have important things to say so we don't mind if your prose is less than perfect — providing submissions have a sensible structure and follow a logical sequence, we can take care of the polishing.

If your article is already written, send it in — taking care to ensure that your name and address, together with a daytime phone number if possible, appears on both the covering letter and the manuscript. Manuscripts should, preferably, be typed or printed out (dot matrix output is quite acceptable) but must be double line-spaced with ample margins top and bottom and on each side. Make sure you keep a copy of everything you send us.

We can now accept articles on a limited number of disk formats: standard IBM SSDD 35-track; RML 380Z SSSD; Sharp MZ-80K/A DSSD, Cromemco SSSD, Nascom DSSD, Rair/ICL DSDD, SD Sales SSSD, Triton 35 track SSDD and ACT Sirius 1 (CP/M-86 or MS-DOS) single-sided. By prior arrangement we can accept stuff over the phone by modem using BSTAM at 300 baud but as we can only do this during office hours (10am to 6pm) it's not exactly a cheap way of getting your article to us! In the near future we hope to be able to accept material by The Source and Rewtel. Please note that if you want to send your article in this way, it should be as an ASCII file rather than as a 'work file' for any one type of word processor - ie, use your word processor to print the text to disk instead of to paper.

Please note that we cannot undertake to return manuscripts, diagrams and photographs, although we always try to return the latter. We can only return disks if they are

If you have an idea for an article or a series, write us a letter outlining your ideas. A one- or two-page synopsis giving the proposed structure, sequence and content is what we're looking for. But before you send anything to us, take a good look through *PCW* to see what sort of articles get published and to see what style of writing we prefer (basically, avoiding promposity at one extreme and flippancy at the other). Also take a look through the Back Issues advert to see what sort of things we have already published — no point in re-inventing the wheel.

Once you've sent off your article or proposal, please don't hassle us for a decision. We receive far more submissions than we can ever use and it takes us a while to sort through them, acknowledge receipt and give an opinion one way or the other. Please be sure to tell us if you've sent the article to another magazine — it would be very awkward indeed if the same article appeared simultaneously in two publications! Frankly, we're more likely to accept something which has been offered exclusively to us.

Finally, we do pay for published work but please be patient! Payment normally follows about 4-6 weeks after publication.

LOOK WHAT "O" DID FOR OSBORNE

O-Computers has done wonders for Osborne I.

We call it Super Osborne. We added refinements
and lowered prices to make it the best value-for-money microcomputer
you can find. For £1499 + VAT we'll sell you our Super
Osborne I with double density disks (normally £1495 on its own)
and all of Osborne's free software, a 12 inch green or amber screen monitor (RRP £99)
and a built-in 80 column adaptor (estimated value £175) plus the brilliant
new Star DP510 100 cps matrix printer (RRP £289) with cable. Or
if you prefer, for £100 more, the Silver Reed portable daisy wheel printer (RRP £485)
which can also be used as an electronic typewriter.

WE GAVE IT 80 COLUMNS

Yes, our Super Osborne allows you to see lines of 80 characters on the screen. You can say goodbye to all that juggling with sideways scrolling that ordinary Osborne users do.

Our design engineers have developed a circuit which fits inside the Osborne and provides video to British standards. You can plug any British monitor into your Super Osborne and get a rock steady message 80 columns wide.

WE GAVE IT A WINCHESTER

And while we were about our redesign, we added to the 80 column circuitry some further eleverness to allow the Super Osborne to use a CONTOUR Winchester disk. That means that when the time comes you can plug in a CONTOUR and suddenly the world is yours with up to 21 million characters of storage. A 5 million character CONTOUR, baby of the range, costs £1195 + VAT.

WE MAKE YOU AN EXTRAORDINARY OFFER

Use the Osborne in your office and bask in the luxury of the CONTOUR Winchester disk's massive story capacity. Come Friday, copy the files you need onto Osborne's new double density floppies, unplug the CONTOUR and carry your Osborne Electronic Office home for a weekend's work. Or use it with its portable electronic printer to catch up on your private correspondence.

O-COMPUTERS

A member of the C/WP Group 108 Rochester Row, London SW1 Take advantage of our £1499 introductory offer. Add a 5 megabyte CONTOUR for £1195, 10 megabytes for £1495, 21 megabytes for £1995.

THE DREAM MACHINE

A profitable use of myths? Maggie Burton asks whether the computer user is being exploited.

Two well worn stereotypes spring to mind when computers are brought into conversation. One is the huge laboratory filled with the requisite ingredients of germanic scientists, odd tubes and flasks full of bubbling noxious liquids and, of course, our old friend the computer with its whirring tape reels, bleeping noises and flashing lights.

The other is the 'open the pod door, Hal' Star Trek animal, as characterised in the film 2001. It knows where the space heroes are going, knows the sound of their voices and probably knows what will happen in the future. Again, all the bright lights, odd pictures on screens and huge tape reels are still there.

The supercomputer as immortalised in films and books for the past twenty years has not changed fundamentally since its conception. What has changed are the voices — they're more human; the lights — more aesthetically pleasing; and the shape, which is now more likely to be hexagonal or otherwise polygonal (witness the CPU of a Cray-1) than the wall-to-wall valves of sixties sci-fi.

Why am I talking about fantasy computers? The answer is this: the fantasy colours people's attitude to the fact. The advertisements perpetrate the myths. Users learn to exploit the myths for personal gain. Bureaucrats and banks hide their incompetence in the data banks of their mainframes. Fantasy computers have apparently random wiles and predilections. They have minds of their own and they can possess the minds of humans. They may make profound and unauthorised governmental decisions. They argue. They might let off nuclear rockets of their own will. On the bright side, they are mentors and encyclopaediae to their users. I read a story when I was about fourteen about a computer which was so powerful it could turn itself off and on at will - and thus could not be shut down by anybody. The machine took over the running of the government who installed it, and effectively scuppered the whole country's essential services. Another recently published novel depicts the tale of the little boy whose best friend is his little computer. Some of these fictional machines are credited with intelligence far greater than that of their human creators.

Now computers are in millions of people's homes thoughout the world. They run many office services and are in use in medicine, science and law. But the myths live on.

The myths live on because the adverts tell you you can do anything with a computer, you ought to have one, it'll solve

tive publicity and so much bungling surrounding computers. Stories about computers messing things up are rife — apocryphal tales have won a permanent place in our culture and are in popular circulation. Computers do seem to have an almost human ability to make mistakes, and in this they are as human as the programmers who fit them for their work. But people still come out with nonsense like 'our computer won't allow that', and so on.

The myths live on because the adverts tell you you can do anything with a computer; you ought to have one, it'll solve all your problems.

In the Colour Genie software review on page 160 I tried to picture the disillusionment which must be felt by many home computer users when they get their machine home only to find it won't load a cassette. The reason for this sort of thing is good old time honoured human stupidity (on the part of the manufacturers, that is). It is reflected now everywhere you look in the computer industry — in marketing policy, in product quality and availability and in support. Particularly, in support.

In the case of cassette loading, I know some companies make cassettes which load far better than those of their competitors—and sell them for roughly the same price.

How, furthermore, can a micro be deemed an educational tool when there is no teaching software available for it? It is only educational as a micro to teach you about micros then, and you can bet your life your kids will be great at little more than playing space invaders or donkey kong after it's been in the house a while. It will not be truly worthwhile having a computer in the home (or in business for that matter), until its limitations are widely acknowledged. The machine can in no way do everything and we have a long way to go before computers are as useful as they might be.

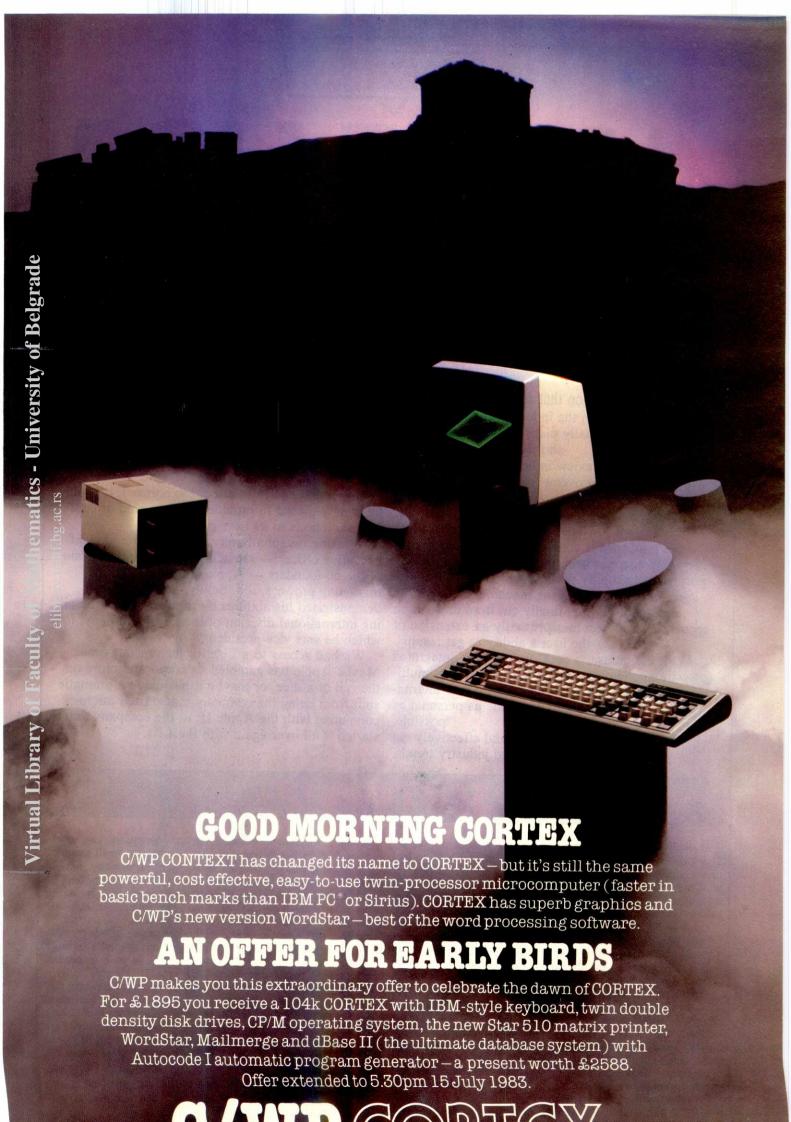

There are still a large number of people of sound (even superior) intellect who hardly know what a micro looks like, never mind what it can do. Buyers are buyers because they 'ought to get one', because 'everybody else has one', because 'computers can make life easier'. They are still buyers in the dark, surrounded by a feeble lack of initiative and imagination and an oily sea of competing adverts. Try looking

and the idiotic way in which some advertisements even try to give their square, dull coloured, sterile products sex appeal of all things!

I may not be in a position to criticise advertising (as long as it isn't actually lying) but I can say this: you can no more teach a goat to talk than you can educate your children using a computer for which the only available software is Asteroids, Adventure, Pacman or downright unfriendly. A lot of imagination, coupled with a lot of revamping of other, older bits of imagination, goes into computer games. Sooner or later it will have to be realised that there ought to be as much genuinely useful software as there are games. While the myths live on, the computers sell - there's no need to worry if there's no software for them. And next year today's popular small micros will inevitably be replaced by a bunch of new ones - with little more software than we know on our micros now.

The sum of all these points is simple: were it not for the myths and fantasies home computers would not sell to anyone who wasn't an enthusiast.

The end product of making computers available to the man on the Clapham onmibus has simply been to add to the confusion and, in many ways, to make even more difficult the integration of these machines into working and home life. I enjoy my computer; but I know what can go wrong. Afficionados can see the pitfalls into which the inexperienced may fall. There is such a rush to get people to buy and not enough of a rush to help them use and benefit from their computers. Money is made overnight. Some have become millionaires but not by being honest with their customers or by supporting their products quite the opposite. As we have already seen, the trend is to keep a computer on the market for a year and then scrap it almost completely in favour of another one which offers twice the capability at half the price. The computer industry should offer at least the support we have come to expect of the motor industry - and this is often not enough. It is high time it was acknowledged that these machines need not be toys which are outgrown in six months - you can buy a video cartridge machine to do that. They have a whole lot of potential which is totally unexploited. Software (again!) should be written to stretch a computer and not hurriedly upgraded from a program written on an older and inferior beast. Is it too much to expect that users - even totally inexperienced ones - might one day get the best from their machines rather than be subjected to money making ploys?

BENCHTEST

APPLE LISA

Robin Webster and Leslie Miner give their exclusive report on Lisa. Here they weigh up whether or not Apple has succeeded in its aim of providing an integrated office system for the single user.

Not all traditional computer users will be happy with the new Lisa Office System from Apple Computer.

It is an indication that something serious has happened in the industry when people get opinionated or unusually picky about the suspected shortcomings of a product.

As the following review indicates, the Lisa represents a vast improvement in the ways in which users interact and the results they achieve with conventional systems. At \$10,000 Apple's new system is not low-cost, but it is powerful. While

the hardware is state-of-the-art in complexity, everything else has been uniquely designed for one purpose: to simplify the interaction for the single-user. The ideal is that the machine, as one of its designers said, 'is finally cut from its roots in accounting and becomes primarily an extension of the user's ability to get results'.

With the mouse, a desktop interface, integrated software applications, and a high-resolution, multiwindow display, the Lisa represents a new alternative: the office computer made as personal as possible.

In fact Apple has daringly and effectively cut across many perceived industry trends.

The feeling within Xerox, the company which did a lot of the conceptual work on window displays and icons with the Smalltalk software system and Star hardware, is reported as being, 'We blew it.'

The kind of response that Apple has had from its potential customers indicates an untapped demand for a Lisa-like machine. And since Apple is now ranked at 411 in the Fortune 500 (one of the youngest companies to attain the honour), it could be ideally placed to provide the right kind of computer solutions to its peer group.

In taking on John Scully as president and chief executive officer — replacing Mike Markkula, one of the co-founders — Apple has sharpened its marketing prowess, too. Scully, has already demonstrated his abilities by turning around the ailing international division of the Pepsi company, for which he was vice-president.

We had access to a Lisa for just a short time. Maybe Apple has gambled its corporate future on the roll of a dice, or maybe it has made a dramatic shift from being the company that started microcomputing with the Apple II, to the company that started it all over again with the Lisa.

SOFTWARE

This review of Lisa took place at Apple's Lisa division building located in Cupertino, California, in what had come to be known as the 'sneak room' — an area with six or so Lisas on permanent display to visiting Fortune 500 managers.

On entering the room, I placed some of my papers down on a table next to a Lisa which appeared to be switched off, and was surprised to see the screen suddenly glimmer. No keys had been pressed, the fact that I had inadvertently jostled the machine's mouse was enough to make it come to life.

Then the screen, sensing that no activity had occurred within a pre-set time, automatically dimmed. This is just a simple demonstration of Lisa's software capabilities.

The designers at Apple confessed that what they had held at the back of their

around which a whole new machine would have to be built, possibly a whole new genre of machines. Indeed, it would probably turn out to be the very machine that they themselves would prefer to use.

The result of this work is a far better understanding (as far as Apple is concerned) of how people interact with computer systems, and notably, a Lisa-like machine. To make absolutely sure that they were on the right track, Lisa's designers arranged with the company's personnel department that all new recruits into the Lisa division should be asked to act as test subjects on the prototype machines. These recruits first level of computer indicated the experience they had, and were then let loose on a machine. Careful monitoring of their responses in specific situations gave the design team a wealth of operating system command line interpreter or shell) nurtures a small group of people who view computing as a challenge — a bit like bronco-busting in fact. They succeed more by conquering the command line interpreter than by using it to achieve results.

But even understanding how a conventional system functions doesn't guarantee that you will always be able to predict how it will perform. Disk errors, system lock-outs, incoherent error messages can destroy the work of even the best user. There's an ever-present fear of losing important data; a lack of reliability. This is what the Lisa team set out to conquer.

Not only is it visually clear where the Lisa user's data has come from and what's being done to it, but there is virtually no fear that any information will be 'lost' in the system.

With features like 'Undo Last Com-

Tom & Jerry ... after Tom is demolished in some way, you know that he'll reappear intact in the next frame.

Icons

ematics - University of Belgrade

Returning to the Lisa that automatically switched its screen on, let's examine what happens the moment a user begins to interact with the machine.

The first thing he sees is a blank screen except for a group of 'desktop' items that are at his disposal — a clock, calculator, clipboard, trash-can, and two special items called the 'ProFile' and 'Preferences' — see Figs 1 and 2.

The clock is used to set the system's time and date information; the calculator is actually represented on the Lisa screen as a full-function calculator and can be used as such; the clipboard is used for the temporary storage of information; while the trash-can is used as a hold area for unwanted files (the last item thrown into the trash-can can always be retrieved).

'ProFile', being the 5 Mbyte hard disk, is equivalent to a filing cabinet, while 'Preferences' is provided as a means of tailoring the Lisa'a capabilities to individual requirements.

These screen images are called icons. In addition other icons can be generated; for example, if you wish to put a new file onto your desktop from a floppy disk, then a floppy disk icon will appear on the screen, with the document name beneath it once everything is loaded.

Even at this stage, there are those who are critical of the fact that such icons are used to depict 'real' objects, and they are critical of the specific icons that have been chosen.

We think that this is beside the point because the icons could be modified and improved upon if necessary. The real question is: 'Are icons a better method of interacting with a system than straight keyboard entry and special function keys?' Moreover, are they useful, and specifically, are they useful to Apple's target users?

What do you do with an icon? This is where the mouse comes in.

The Mouse

The mouse controls the screen cursor which can be moved directly to any icon. The icon can then be selected by pressing the mouse button once. Once selected, the icon changes into a negative image (that is, from a black outline on a white background to a white outline on a black background). The user can now act upon the icon by moving the mouse/cursor to a one-line menu bar across the top of the Lisa screen.

Menus

One-line system command menus are not new. The Lisa version seems to have some of the characteristics of the UCSD p-System menu. When you change from the top-level compile and execute menu

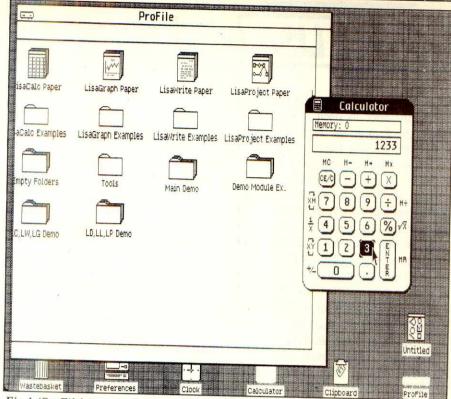

Fig 1 'ProFile' is equivalent to a filing cabinet.

Fig 2 'Preferences' allows Lisa to be tailored to individual requirements.

keeping with the mode. It's no use having the 'Compile' option while you are still using the screen editor, to create code. The Lisa menu does change as well, not in terms of the mode (because Lisa genuinely is a modeless system), but simply to keep track of the applications currently in use.

If you are using the spreadsheet tool you are given a menu which reads: File/Print, Edit, Type Style, Page Layout, Format, Protect, Calculate. If you simply start at your desk and wish to see what's stored on your ProFile hard disk, you select 'View' from a simpler general menu: File/Print, Edit, View, Disk. By selecting View from the menu while hold ing the mouse button down, a range of more specific options are revealed in the form of a pop-out or pull-down menu.

'View' gives you three ways in which you can display the ProFile contents: Pic-

you simply 'pull' the cursor down over the options and once the relevant one is backlit, let go of the button.

If 'Alphabetical' or 'Chronological' are chosen from the pull-down menu, the user is given a very recognisable directory listing which includes file names, file sizes, and the time and date they were created

If 'Pictorial' is chosen, the user gets a first introduction to the Lisa's 'window' concept. An actual window opens up on the screen with the title ProFile. In the window are all the files on the disk represented pictorially as folders. New, unused files, seen as pads of stationery, are present too. The pads and folders are also icons and can be acted upon in the way described above.

Short-cut

a much quicker way to achieve the same result. In order to open a folder, say, within the ProFile, or even the ProFile icon itself, clicking twice on the mouse button will also open and close icons.

Once you are in the Profile window, suppose you want to look at a particular folder entitled 'Correspondence'. You again place the cursor on the folder, select it with one click, and then either click again or go to the command menu at the top of the screen to open it. A new window appears out of the Correspondence icon, and ends up overlapping the ProFile window - much as two documents would on a real desktop.

Note that although many windows up to 20 or so - could be open on the desktop at one time, only one window can be active. If you want to look at a window lying beneath the currently active one, you must first select it with the cursor.

The mouse can be used to select either window, to change its size, or to scroll the window contents. Double click on the Correspondence folder and it shrinks back into its icon in the ProFile window - or double click on, say, an annual report folder, and its window will be opened up on top of the Correspondence

Looking at the graphics orientation of the machine - the windows, the desktop metaphor and the icon images are just the beginning - you can see why the Lisa has been called 'intuitive' for office

Tools

Held on the ProFile in addition to the folders and stationery are a range of other icons, which the user simply knows

LisaList — a personal database management program of the list processing kind.

For the user, it is possible to build a spreadsheet, generate a pie chart from all, or part, of it, immediately change the pie chart to a bar graph, add a personal memo to the graph, edit the memo, add a free-hand drawing, and then get an exact printout of the composite document.

In addition, while the Lisa user can move from one program to another with ease, he also uses - as much as possible - the same operations in each application. This reduces the amount of time that has to be devoted strictly to

It's pretty clear from asking various people, that the name Lisa wasn't much more in the beginning than a project tag for Apple's personal office system. However, the company now allows the acronym to mean Local Integrated Software Architecture.

The following is a description of how we created quickly quite reasonable output illustrating some of the above proparticularly LisaGraph, LisaDraw, and LisaProject. Although these programs may not be the best in their fields, the fact that they all go to make up one integrated environment is of greater significance than a one-on-one comparison.

LisiCalc

First, we decided upon some fictitious data we could use as the raw input for a LisaCalc spreadsheet. Although this program can handle 255 rows by 255 columns (compared with Multiplan's 255 x 63), we decided on a more modestly sized matrix. The spreadsheet topic was projected sales figures for the Lisa, Apple III and the IIe over the 1983 to

In line with other spreadsheet systems, LisaCalc offers the user a range of cell formatting and formula creation/copying facilities. While the mouse can be used

(can usually cancel the effects of the latest operation), and 'Revert To Previous Version' (this very useful feature can get you out of many sticky situations by dumping everything out and reloading the last saved version of a spreadsheet). Since LisaCalc can manipulate a 255 x 255 matrix, the multiple window feature - up to six horizontal or vertical splits can be made per spreadsheet - is also a necessity.

For the Lisa, we decided to show sales increasing over the three year period from \$100 million, through \$400 million, and reaching \$600 million in 1985. Figures for the Apple III were \$250 million, \$350 million, and \$500 million, while for the Apple IIe sales jumped up from \$700 million to \$1000 million and then on to \$1400 million. By entering a formula for the first column of data we obtained the total income figure of \$1050 million for 1983. This formula, which merely added the amount of each product's sales in 1983 together, was then copied over to the 1984 and 1985

The next step in the procedure was to select the six sales cells (the total income figures were not included) from the spreadsheet and place them on the clipboard icon for temporary storage. This can be achieved by clicking on the relevant cells, and then using the COPY function available from the Edit menu.

LisaGraph

To put the LisaCalc data LisaGraph, we had to open up the LisaGraph icon. Once this was open, we used the 'Paste' option from the Edit menu to transfer the LisaCalc sales information from the clipboard to the graph. Almost immediately, we obtained the bar graph shown in Fig 3. By simply choosing one of the menu options the bar graph could rapidly be changed into one of the following: line, mixed bar line, pie, and scatter graphs.

Other features of LisaGraph are that data changes are replotted instantly in a 'what if?' manner; the screen size of the graph can be enlarged or compressed; graphs can be printed out in four different sizes — ¼ page, ½ page, ½ page, and full-page - and graph areas can be shaded in many different patterns. Also, in keeping with the concept of integration, certain functions, such as the selecof numerous typestyles combinations of typestyles for titles, Undo Last Command and Revert to Previous Version are ever-present.

At this point, we printed our LisaCalc/ LisaGraph work out on a dot matrix printer and switched to LisaProject.

Lisa Project

LisaProject enables a manager visually to map the progress of a project. Individual activity, or task boxes, are created by the user and linked to form a

schedule of activities leading to a goal. For review purposes, we decided to create a simple 'Apple Team Project'

'Lisa will be considered successful if the user can accomplish something unaware of the complex underlying engineering'

as 'Tools'. These are the six application programs, whose integration is a key feature of the Lisa system. To the user this means that he can use any tool on almost any document, at any time, just as he would at his desk.

The six packages are:-

LisaCalc — a speadsheet program.

LisaWrite — a word processing program. LisaDraw — a very impressive drafting/ freeform drawing program that can be used in its own right, or to enhance the output from other Lisa Tools.

LisaGraph — generates all popular format graphs from LisaCalc or keyboard

entered data.

LisaProject — generates a PERT-like project management schedule or flowchart, to select cells for data entry, the cursor control buttons on the numeric pad can prove just as handy. There are two nice features about this program. It shows which cells are being changed during a 'what if?' calculation by shading them grey. And if you want to format, say, a money value, the exact way it will appear is controlled by the contents of the 'Format' pull-down menu. So, if you want your dollar amounts to be preceded by a dollar sign, and show commas for thousands, you would use the mouse to select the '\$1,235' option. If you wanted it to appear with cent amounts, you

would choose the '\$1234.56' option. Special cell features include cell lock, circle missing values (this highlights those cells referenced by a formula but

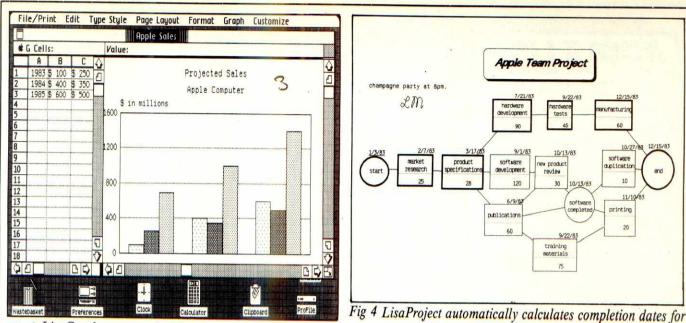

Fig 3 LisaGraph generates bar line, pie and scatter charts.

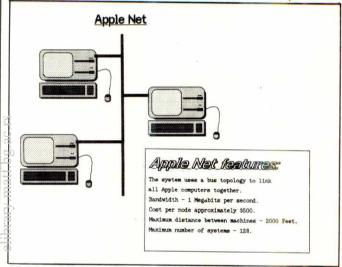

Fig 6 The Lisa drawing was composed with shapes from the palette, then shaded and cloned.

the user to visualise project tasks and resources in two other forms besides the schedule chart reproduced below.

ex

There is a Task Chart and a Resource Chart; the latter is a kind of personnel availability calendar, looking a bit like those holiday charts used in offices. The former, while it resembles the Resource Chart, displays projects tasks in the order in which they will be performed.

LisaDraw

Now here comes the fun ... We took our LisaProject schedule and pasted it into a LisaDraw window, so enabling us to enhance the diagram for use in a pre-

A LisaDraw palette with ten options is displayed vertically down the left of the screen (Fig 5). Besides various shapes and lines, there is a free-hand symbol and a 'Text' option. Selecting the Text option, we first added a small memo (champagne party at 8pm) and then signed initials via the freehand line draw. We then gave the title a new typestyle, decided to reposition it, and put a box around it. Further enhancements to the text were always

possible since there are eleven typestyles and other possibilities such as: Bold,

LM

Fig 5 The ten options of the LisaDraw palette are displayed vertically on the left of the screen.

LisaDraw used to enhance something from another program, the next illustration was created entirely within the LisaDraw environment.

Again, the document was fictitious in nature (only the Apple Net specifications box is completely accurate). Using the Text option, the memo heading and other text was entered onto a piece of blank LisaDraw paper — no attention was paid to typestyle at this point. By selecting various primitive, or ready-made, objects from the palette (a rounded corner rectangle for the system unit, another for the screen, a right-angled rectangle for the keyboard, and so on) the Lisa drawing was put together. The mouse was a small box, but its lead, or tail, was drawn freehand (Fig 6).

The disk drive slots were drawn in under 30 seconds using lines of various thicknesses. At no time was there any fear of making a terrible mistake since all the lines and boxes could have been squashed to make them smaller, stretched to make them larger, or, if you really got into trouble, the Undo Last Command would come to the rescue.

Just to show how it would look, we then selected three different shades from a total pattern selection of 36, and

based on the Lisa project itself.

Every LisaProject chart has at least two 'milestones' (Start and End) which are displayed as circles. The specific activity boxes, such as the market research task and the connecting lines between them, are easy to draw with one movement of the mouse.

It is equally easy to add a box — like that marked 'training materials' - and to reduce the chart to a one-page display by selecting the relevant pull-down menu option from the 'Customise' command above (see Fig 4).

After each box is drawn a small cursor appears within it, signalling the user to insert text. This would be the name of the activity, its duration, and, perhaps, the particular staff member responsible for it. When we inserted the Start date within the left-most circle, LisaProject automatically calculated the completion dates for each activity and the End of project; it also highlighted the so-called Critical Path, the route along which any delays would delay the total project.

One of the major achievements of the Apple software designers is that they have brought the same 'what it' scenario

flexibility demonstrated in the LisaCalc and LisaGraph to LisaProject. Alter the

APPLE LISA

box around the text at the bottom right was put there by again selecting the right-angle rectangle from the palette.

The titles 'Apple Net Features', 'Apple Net', and 'Memo' were then all customised using the typestyles option. The signature, on the other hand, was a bit more difficult.

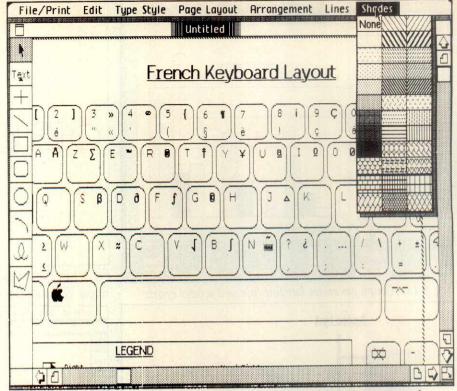

Although we were the proverbial naive users, the main memo design work took about ten minutes (it could have been done much faster, and much better). Owing to unfamiliarity with the system, the freehand signature took maybe that much time again. There is no doubt that LisaDraw is the most visually impressive piece of software that an office computer user could hope to have at his or her disposal.

As any new Lisa user will find out, the hardest thing to master is freehand drawing with a mouse. 'It's like painting with a rock' as somebody said after the experience. You do eventually get the hang of it, though.

LisaWrite and LisaList

This brings us to the final two Lisa application programs which we did not have time to use in detail, but which should be covered briefly.

LisaWrite, the word processing pro-

There are 36 different patterns for shading. This French keyboard was created with the palette; freehand drawing with the mouse is the hardest to master.

gram on Lisa, is probably the best 'what you see is what you get' editor around. The combination of the mouse and keyboard allows fast selection, editing and reformatting of text. Block moves are very easy, for example, and all standard word processing features are provided. All typestyle, editing and Undo type features available with the other programs are used to their fullest in LisaWrite.

LisaList is described as being a personal database system. Essentially, it lets

a user input personal types of information — phone lists, customer lists, per sonnel details — and then sorts them by some specific attribute or combination of attributes. There are eight data field types: text, numbers, date, time, phone number, social security number, zip code, and money.

It comes with a file-recovery system that helps rebuild damaged databases in case of system or software malfunction. This should be welcomed by users since

Dialogue boxes (error messages)

Typical error messages, as you know and hate them, can be a pain to deal with. This is either because they are of the 'XYXXE/2345.B, Diskerr...' type or they are crushingly blunt: 'Fatal error on system disk...'

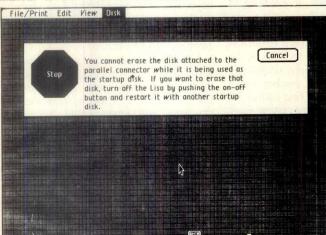

If you are lucky, the manufacturer of the machine or the software vendor will have moved one step ahead by basing error codes on a numbering system. So, if you have a disk error, the system generates a particular code number and you look in the manual to see what action should be

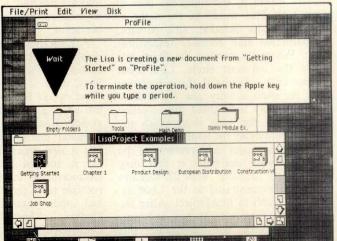

taken

The Lisa, we think is way ahead in this field. Instead of error messages per se, the Desktop Manager communicates problems and warnings to users by the means of dialogue boxes. These dialogue boxes make use of familiar road sign shapes, so they are both visually obvious and unambiguous.

The messages included in the boxes do more to calm the user than quicken the pulse. The writing style is very casual, yet precise, and the boxes are big enough to allow complete paragraphs of text, the dialogue road sign, and a menu selection area for the user. Cancelling a dialogue box cancels the command that brought it forth; selecting whatever other options may be offered will have a similarly logical effect.

Not once during the many hours we spent on the Lisa did anything catastrophic happen to data we were working on. Unlike the general type of error message, the Lisa version does not elbow aside your work just to make itself known.

LisaList can handle up to about 600,000 bytes (say, a 6000 x 100 character list) of data.

The main point about all of these integrated software programs is that they are designed to be understandable. They are not primarily designed for specialist tasks, but to make people feel comfortable rather than hesitant in their everyday office work.

The icons, windows and error messages (which appear as large road signs) are common to all programs, and are symbols of a physical world to which people can relate. The supposition is that people want to feel in total control of a concrete (rather than an abstract) manipulation of data for their concrete, real-world, projects.

As one of the designers told us, Lisa will be considered successful if the user can accomplish something without being aware of the underlying complex engineering that went into making the product reliable.

Lisa communications

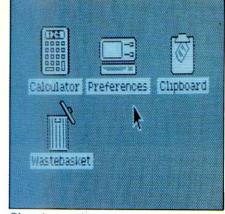

Since the corporate office structure tends to be distributed both in a local and remote sense, Apple has had to devise a method of linking its Lisa equipment up into networks while at the same time keeping additional customer costs to the minimum.

The first communications product to come out on the Lisa will be Lisa Terminal. It will be another Software Tool and, as such, will be accessible through its own individual icon and tear-off stationery pad. LisaTerminal will provide TTY, Digital Equipment VT52 and DEC VT100 terminal emulation capabilities. The first release will not be able to handle sophisticated Lisa/host computer interactions; the uploading and downloading of text created in LisaWrite or LisaCalc is likely to be the major initial component.

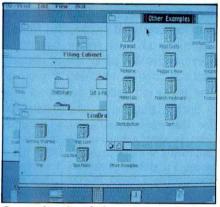

Sometime later this year various IBM emulation programs will be released, putting the Lisa into an entirely different kind of ball park. There will be 3270/3271 Systems Network Architecture (SNA) support, 3780 Remote Job Entry support, and 3278 terminal emulation.

In a deal with Cullinet, formerly Cullinane, Apple will also be able to offer that company's Information Database product. This will allow Lisa users to top information stored on IBM mainframes in Cullinet's IDMS/R relational database product.

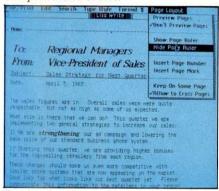

Also due for release this year is Apple Net — a low-cost, low-speed (1 Megabits per second) local area network system that can be installed at a cost of approximately \$500 per user connection, or node. This will link all of Apple's products — the Apple IIe, Apple III, and Lisa — together. It features the Carrier Sense, Multiple Access/Collision Detection (CSMA/CD) transmission protocol as

Clear instructions.

Comprehensive choice.

Laying out a memo.

For those who want something more, Apple has arranged a deal with US company 3Com whereby 3Com will supply interface boxes that will tie Apple equipment into an Ethernet network (which has a 10 Megabit per second transmission capability).

The changing Lisa cursor

One nice touch about the Desktop Manager system on Lisa is that it has been programmed to take account of what might at first seem to be a trivial display aspect.

Although the main cursor is always shown as a slightly inclined arrow (1), there are in fact six other cursor styles the user will discover. Within the matrix of a LisaCalc spreadsheet the cursor becomes a hollow 'plus' sign (#); in LisaWrite it becomes an I-beam(x) to allow the user to carry out precise selections, such as a full point or inter-character space, during editing work; in LisaDraw it takes on the shape of very small crosshairs (+) and the grabhand shown in Fig 5. While the Lisa is

The Application

Developer's

Toolkit

If the Lisa depends on any one thing in particular, it is the Application Developer's Toolkit (ADT) — the key method by which independent software companies will be able to create applications that make full use of the Lisa's mouse/screen/Desktop Manager.

The ADT has been under development for the last nine months and is now undergoing tests. The project was headed up by Larry Tesler, a key man in the overall Lisa project who originally worked on the Star system at Xerox. He has the honour of being one of the people who showed Apple staff members, including chairman Steve Jobs, the Star's abilities, an event which was to lead to a \$50 million, three-year project that came up with Lisa.

Independent software is already being put onto the Lisa; Xenix is expected to be available this month and CP/M-68k shortly thereafter. But it will not make full use of the Lisa's Desktop Manager. The user will get some fancy graphics, but not the cut and paste type of operations.

What the ADT does is to give the software designer direct access to a framework Desktop Manager — windows can be displayed as a matter of course, but the interactions possible and the types of data they will contain is left open. Essentially, the programmer fills the empty Desktop Manager with his own data control code. The ADT is a kind of Software Workshop. Problems like, 'how do you best represent an accounts receivable package with an icon?' are still not completely answered, though.

Apple research has shown that traditionally trained software people can take six months to get up to speed in terms of writing code for the Lisa, so the ADT will obviously be of benefit here. To make sure that they are not too strained, though, the ADT project workers have actually gone as far as extending the Pascal language so that classes of objects can be more easily referred to, but the code is still recognisably Pascal. Apple's Pascal with extensions is called Clascal and will most probably be made available as a separate product, outside of the ADT, at some future date.

As an added incentive to interested software companies, Apple is also offering selected organisations significant discounts on the Lisa (with a maximum of two machines per company) plus hotline support. Response has been high and machines are being shipped out. Companies like Digital Research and Microsoft have had machines for quite a while.

Apple states definitely that it does not want to get into the operating system or

HARDWARE

Reviewing the Lisa in terms of what its hardware looks like and can do is rather misleading since there is no one part of the system which can be described as stand-alone. The integrated truly Desktop Manager software/the highresolution screen/the mouse/the so-called Software Tools, and the CPU all work together in a highly coordinated manner. To force a distinction between 'the and 'the software' really hardware' overlooks the purpose of an integrated user environment.

At the very least, though, a description of the hardware will give you an idea of what it takes to make such a 'new wave' machine perform.

First of all, there are a couple of things to point out.

There is no such thing as a 'standard' Lisa in the conventional use of the phrase. Look at most computer manufacturers price lists and you will come across this mythical machine.

It always comes with too little main (RAM) memory; there probably isn't any disk storage included but, if there is, it will most likely be one drive; the video display will only provide the user with the simplest level of character generation; and, generally, no software will be present — except that locked in to boot ROM.

By the time you have purchased enough 'option' cards to make the thing do more or less what you want, the standard machine price has long receded into the distance and you really have made a capital investment. (Apple is a major offender here.)

This marketing approach, while comfortable for many manufacturers, tends to start customers off on the road to being something akin to system builders—they continually come across obstacles that can only be overcome by going out and buving more add-on equipment.

Such a situation is totally unsuitable for the professional/business customer, who is simply looking for methods of improving working practices. With this in mind, I'll give a quick overview of what the hardware looks like and then move

on to specifics.

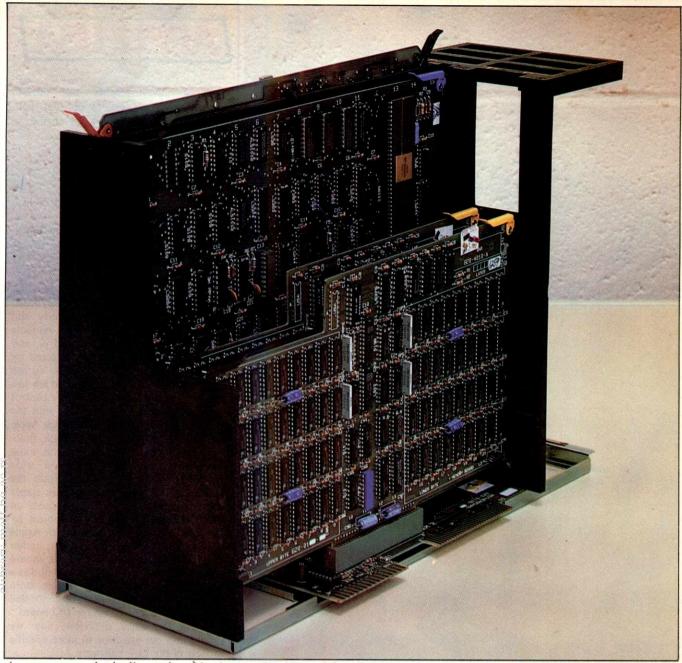

For \$9995 a customer gets a complete Lisa system. This consists of the six integrated Lisa programs; the system box containing a 12in video display, the 68000 CPU, 1 Mbyte of RAM, and two of the Apple designed floppy disk drives; a 5 Mbyte ProFile hard disk; an IBM Selectric style keyboard; and, of course, the mouse.

The System Unit: Lisa's case is made of moulded plastic and, while pleasingly compact, is smaller than one might imagine from photos. The 12in video screen is placed over on the left, while the two floppy drives are immediately over to the right. A nice touch is the hollowed-out area underneath the display and drives. Since the mouse is used for a majority of file and data manipulation tasks, this is used as a storage bay for the now under-used keyboard. Tucked almost out of sight to the right of this bay is the Lisa's shut-down key. Shutdown rather than on/off switch because the Lisa is designed to ensure that all open files are closed (that is, returned to

All 76 keys are programmable but the mouse is used to issue most commands.

A user can completely dismantle a Lisa into serviceable modules.

their relevant folders) before poweringdown. This is a very powerful example of the interdependence between Lisa hardware and software.

One might imagine that because there is nothing but heavy disk drives and video equipment towards the front of the system unit, the Lisa might have a tendency to tip forwards. Apple designers overcame the problem by placing a couple of Sphinx-like paws on either side of the keyboard bay. Cooling vents are situated around the top, back and sides of the casing. All I/O connections are sited along the lower back.

Display

Having seen high-resolution systems such as the Three Rivers/ICL Perq and Apollo Domain, it wasn't too surprising to see a 720 x 364 bit-mapped video display which did a marvellous job of impersonating a piece of paper. The surprise is that it is now available on a commercial office product, using more or less standard chip technology, offering a set of six integrated software programs for

under \$10,000. Apple managed to keep the hardware costs lower than they might have been by deciding to use a 12in (half-page) screen format rather than the giant full-page (1024 x 900 pixel, or thereabouts) monitors supported by the Perq and similar devices. Also, since the screen is bit-mapped (each addressable picture element, or dot, can be represented by one or more bits in a reserved sector of memory), the smaller screen requires less attention from the CPU. The Lisa team decided not to use a graphics chip to handle the screen display (because they felt it might actually slow things down ...) so the Motorola 68000 CPU currently timeshares cycles between main processing and the video memory map processing.

Mouse

A pointing device has now replaced keyboard input as the prime method of issuing commands to a system (see box for a discussion of mouse technology). Apple has trademarked the phrase Graphics Mouse Technology, which might suggest

to some that it is the first company to come up with a successful version of the device. This is not absolutely true. There have been many previous mice — some that were like enormous flywheels and just kept going in one direction. There are mice of various sizes, colours and complexity, including the three-button

'Like a jet engine, it can't turn a car into an aeroplane'

'Rolls-Royce' of mice made by a US company called Hawley. At the recent West Coast Computer Faire, a recent entrant — with just two buttons — could be seen controlling editing functions on an IBM PC. What Apple has done is to streamline the device, going for reliability and ease of use. While manipulating the palm-sized mouse is simple, its integration with the Lisa software (something which does not have to be obvious to the user) is very complex. Not just any mouse will do — end users should be

Apple has made the dot-matrix printer respectable.

Printers

It's nice to see that Apple has made the poor man's printer—the dot matrix system—respectable. To get the high-quality graphics printouts reproduced in this review, Apple had to inform the Japanese printer company, C Itoh, that its printer could produce the required quality. The printer, which now has a ROM chip customising it to the Lisa, 'paints' a piece of paper with dots. In low-resolution mode, the output is quite good; in high-resolution mode the output is of presentation quality. Most of the screen dumps reproduced in these examples were done in the low-resolution mode.

Reluctant to leave well alone, Apple decided that the Lisa user must have the option of a letter-quality daisy wheel printer as well — but it had to be able to do graphics. To achieve this, Apple created a completely new 130-spoke print wheel for a printer from Qume. It will reproduce all the special symbols, including foreign variations, and allow a single printout to combine various typestyles (such as standard mixed with bold and italics). Graphics output, using special dot symbol spokes, can cope with Lisa screen dumps, but they are not really as good as the dot matrix version.

APPLE LISA

wary of advertisements and mouse manufacturers' suggestions of what their product can do. Like a jet engine, it can't turn a car into an aeroplane.

Keyboard

The Lisa keyboard is a standard, Selectric style version with 76 keys - all of them are programmable. Since the mouse has been given the main burden of issuing commands and manipulating objects and data, the keyboard does not come with row of special function row upon 'headstones'. To the left of the keyboard is the main section of the qwerty and multi-character keys (special symbols such as omega, mu, epsilon and pi, and other unusual characters are selected by the correct use of the shift key). To the right is an 18-key numeric pad which has the four left/right/up/down cursor control markings sharing key-top space with the '+', '/', '*', and ',' symbols. Although Apple decided against straight, one-punch, function keys, it is possible for the more experienced user to generate a wide range of special effect codes from the keyboard. For example, at certain stages while using LisaDraw it is possible to erase selected portions of an object by pressing the 'Apple' key (it has an Apple logo on it) and the 'Clear' key, rather than selecting the object with the mouse and then going to one of the pull-down menus to select a similar procedure. Both the keyboard and mouse are controlled by a COPS processor on the I/O board.

That's the quick overview; now we should turn our attention to more specific aspects of the Lisa hardware.

Inside

Getting into the machine is no problem since there is both a back and front cover. No special tools are needed for their removal. This design philosophy has been carried right through to the point where a user can completely dismantle a Lisa into its serviceable modules — the twin disk unit, circuit board carrying frame, power supply, and even single boards — in a matter of minutes (for the full implications of this, see 'Conclusion'). The only non-user accessible unit is the high-voltage video circuitry and monitor.

Inside the machine to the left there are three empty expansion slots. Currently, the indication is that Apple will not rush to fill these, rather, it will encourage independent hardware vendors to offer their products. From the hardware engineers' point of view, the expansion slots provide a very simple means of attaching all sorts of devices to the Lisa. Simple, because the slots provide add-on cards direct memory access (DMA) instead of routing signals via the CPU.

Apple's only current exception to the 'no add-on cards' rule is a parallel interface board (\$195) which is needed to help manage the generation of high-quality out put on a specially redesigned dot matrix printer from the Japanese company C Itoh. While this does take up one of the three expansion slots, Apple is working on a serial version of the matrix printer which will use one of the two RS232 ports on the Lisa.

All circuits boards, expansion slots, and even the I/O connections, are held in a specially designed slip-out carriage. This board holder is a novel method of securely retaining a lot of hardware in its place, while at the same time making access extremely easy.

· Since the holder is only connected to the main system box by gold-plated edge connectors, simply tugging it towards you makes it glide out smoothly. If you ever ripped yourself to pieces trying to remove a board from an old terminal (the soldered side was usually loaded with razor-sharp objects right where you had to grip it), or ever found out too late that you had put the CPU board into the wrong slot, you'll appreciate what Apple has done for the user in this area. Every board has been supplied with colourcoded grips and unique edge connector layouts so that it is impossible to damage vourself or a board.

Although I mentioned earlier that the Lisa has a shutdown button, the machine is never completely off. A battery pack located on the I/O board maintains the system in a kind of slumber, waiting for some one to come along and press a key to reactivate it. This is rather like the temporary display blanking that some calculators use to conserve on energy while retaining numbers to be eventually used in a calculation.

Motorola 68000

Having conceived a complex software environment for the user, Apple designers were aware, even at the theory stage, that a fairly powerful processor would be required to cope with the kind of activity that would be required of the Lisa.

There are a couple of reasons why the Motorola 68000 was chosen.

This 32/16-bit chip (almost all its internal CPU registers are 32-bit while the external data paths, along which data is fetched and sent back out, have a 16-bit transmission capacity) has been the choice of many specialist multi-user system builders for the last few years. Only recently has it been receiving the kind of general attention it warrants.

Sage Computer Technology chose the chip as a powerplant for the Sage II. It is also the featured chip in the Corvus Concept, the Tandy TRS-80 Model 16, the Fortune 32:16, the Wicat and the somewhat intriguing IBM 9000 scientific system.

Apple adopted the 68000 because it was the best advanced chip available in sufficient quantities at the time the Lisa project began (1979).

Early samples were used for prototyping, but it was not until Motorola could give assurances that 5 Mhz versions would be available in production quantities that Apple made the commitment.

While offering the power of a true 16-bit chip, assisted by its 32-bit internal structure, the 68000 couldn't give Apple's software designers one muchneeded break. Sitting inside the Lisa is about 2.5 Mbytes of object code which makes up the Desktop Manager system. Add to this the code which makes up the various Software Tools — LisaCalc, LisaWrite, LisaDraw, LisaGraph, LisaList, LisaProject range in size from 200k to 400k — and you have an enormous problem shifting that number of

area are the cooling fan and the disk drives. This first problem was overcome in the Lisa by devising a passive, or convection, cooling system. Since warm air rises, the designers arranged for all the main circuit boards to be held upright in a special carrier frame. As the boards begin to generate heat, it is taken in by the surrounding air which then escapes through vents positioned at the top, back and sides of the casing.

It seems to work well as there were no signs of internal overheating during the review sessions. Nor did it get perceptibly warmer around the machines.

The second potential source of noise, the disk drives, never had to be dealt with. The 5 Mbyte ProFile disk (which

'Apple designers were aware, even at the theory stage, that a fairly powerful processor would be required'

bytes around in a reasonably professional manner.

Memory management facilities developed by Apple for the 68000 make the software handling task much simpler because it offers the ability to relocate blocks of code in memory — virtual memory in fact. To quote the Lisa specification sheet, the memory management system on the machine allows for the 'segmentation (of memory) into 128 variable-length blocks dynamically controlled by memory map table'. That's 16 Mbytes of virtual memory.

In addition to having an Apple-added virtual memory facility, the Lisa can do multi-tasking and lock out bad memory cells. While one job is being printed, a user can go ahead and use the LisaCalc program, or whatever. If memory errors occur, the system will not halt all processing until repairs take place. Rather, the parity checking system will steer all operations away from the faulty sector(s) and so allow Lisa to continue processing.

Diagnostics

Keeping with recent industry trends, the Lisa comes with built-in diagnostics that go into action when the machine is fully powered up. The user is given a set of visual symbols denoting which piece of the system Lisa is currently testing, and, if everything goes well, tick-marks appear in each symbol field. There is a full 64k of diagnostic code held in ROM (remember, that's the size of many standard personal computer main memories) and if the display is not working, the Lisa emits specific groups of tones from its internal speaker that can be understood easily by a user.

Noise

Noise can be a problem in an office environment and, as many personal computer users would testify, their machines are not always as quiet as they might be.

The biggest traditional culprits in this

was originally built for the reasonably successful Apple III) has always operated with a minimum decibel output. Most of the Lisas have ProFile placed conveniently out of the way on the main system unit. Although this is not a prerequisite, it certainly reduces space requirements on a desk.

Disks

Most floppy disk drives are worth just a quick look to see if all the bits and pieces are there and how much storage they provide. If you're really lucky, you might even find out that the machine you're thinking of buying can read disks of different formats.

In the case of the Lisa's drives, it's worth devoting more time, since by standards, they are excellent.

While the ProFile gives 5 Mbytes of storage — a common enough amount by today's standards if you look at computers like the IBM XT, ACT Sirius 1, and Wang Personal Computer which come with, or can be configured to have, 10 Mbyte drives — the two floppy drives cope with 860k formatted (1.4 Mbytes unformatted) storage each. Therefore the total removable storage is over 1.7 Mbytes . . .

Here's how Apple managed to create such a dense packing of data on a 514in disk.

Traditional double-sided disks rotate at about 300rpm and store somewhere in the region of 200k to 400k — a notable exception to the rule being the 600k+drives of the Sirius 1. The Sirius 1 uses multi-speed drives that can spin standard disks at up to 350rpm when necessary.

Apple decided that rather than stay with commercially available drives, which didn't offer the kind of functionality or reliability the Lisa demanded, a totally new unit using a totally new 51/4 in disk would have to be built.

A Synertek 6504, which is not too far off from the 6502 chip that has kept the

Apple II running and running, is dedicated to each of the Lisa drives, acting as smart interfaces with the main system. One of the jobs the 6504 has is to vary the speed of the drive in keeping with the position of the track it is reading or writing so that data is laid down in a regular density of 10,000 bits/65.4 tracks per inch.

Since ordinary drives rotate at one speed at all times, regardless of where the recording head is located, data is more densely packed on the tracks closer to the disk centre (where the disk surface is travelling more slowly than at the outer edge) and relatively sparsely elsewhere.

The internal set-up of the Lisa drive is also very different from other double-sided units. Rather than having both heads

positioned so that the disk media is pinched between them, increasing wear, the Apple drives have offset heads and special opposing pressure pads that access the disk surface through two cut-outs in the disk jacket. In the early development days of the Lisa project, having such unique disks was a definite advantage because even if a prototype machine had been stolen, illegally borrowed, or whatever, the fact that virtually all disks were kept safely locked up meant that no harm could be done.

Now that the Lisa is ready for the market, one wonders what kind of production arrangements Apple has made. Certainly, at the time of this review, no one at the company could give me any details on pricing, etc.

Security

We're not yet finished with the disks, because there are two remaining features that must be covered — data integrity and data protection by means of automatic disk retention.

Files stored on a disk are located by means of a directory set up on a particular grouping of tracks. If this map-like data should be corrupted in some way - either by software or system failure - it is not always possible to recover all the lost data held on the disk. The Lisa drives, however, are made to lay down a special block of 24 bytes per each 512 byte disk sector. Contained in these 24 bytes is a description of which file the block belongs to and where in the file it should appear. Further pointers to disk space allocation are also held within files themselves and in the main directory. Inevitably, some information will be lost. but it will have to be precipitated by something fairly catastrophic.

If you've read something about the Lisa you will already know that its disk drives do not have the conventional flip-down doors which can be opened at any time, regardless of what is going on. Instead, the drives have an automatic lock and load feature made possible by automatic 'disk present'

The Mouse

The difference between the traditional keyboard and a mouse is essentially the difference between sending morse code signals down a wire or using a telephone. While the telegraph and telephone achieve more or less the same result, the speed of interaction, and what might be called the fluidity' of communication, are just not comparable.

People first interacted with computers via teletypewriters — electromechanical devices that generated printed text either from an attached keyboard or in response to computer output. So it is not unnatural that they should have become used to dealing with line by line printouts that were issued in true typewriter fashion. If they wanted to leave blank lines on a printout they had to hit the 'line feed' key the required number of times. If they wanted to write something only at the end of a line, they might use the space bar, or tab key, to move the printhead over to the right.

Things remained pretty much the same even when paper was replaced by cathode ray tubes (CRTs, VDUs, or whatever you like to call them) as the prime method of displaying user input and computer output. The print head was replaced by a flashing or solid cursor (an underline, or solid square), but the user could still only move around the screen in discrete up/down/left/right movements. Cursor addressing, a facility made more accessible by the higher-level languages, was used but this was handled strictly at the program level.

The mouse unlocks the cursor from its straight-line existence and instead gives the user total control of its positioning. Connected to a computer by a thin cable (the tail), the mouse consists of a palm-sized package of electronics and mechanical/electrical/optical equipment which converts analog movements (drawing of a circle, for example) into digital signals. These digital signals are than acted upon by the relevant onboard processor, and a circle appears on the display.

Apple's mouse is probably one of the

simplest to use. Where others come with up to three control buttons, Apple's has only one for all actions. The multi-button mice have a sense of function keys about them you push this one to do action number one, then you push the other to do action number two. This is because they are generally used with far simpler software than that supplied with the Lisa. The Apple mouse demands only that a user follow the simple rule: if you press the button twice to open one icon, you do exactly the same for another icon, independent of the program or stage you are at; if you want to select something from the pull-down menus you always click the button once after the required option is backlit.

Of course, there are times when the mouse becomes clumsy or redundant and that's why there are still cursor control and special escape keys/key sequences on the Lisa keyboard.

Lisa's engineers are sometimes criticised for selecting the mouse rather than other quick data input devices — notably the trackball, touch-screen and light-pen.

They point out that the trackball (which can be thought of as an upside-down mouse) requires two quite distinct operations. First you use your fingers to roll the cursor control ball as is necessary, then you have to reach over and press a command button. The mouse user can both move the device and press a button at the same time, so maintaining smooth movements.

The touch-screen and light-pen both have the limitation that the user must first identify the location that has to be touched, and then a physical movement has to be made to identify or select an object. Delay and arm fatigue can be a problem here. Also, touch screens do get fingermarked and light-pens have a limited resolution. If there are two option boxes placed very close together on the screen the pen might only be able to straddle them, and not deal with them as two distinct objects.

The Lisa mouse is simply built. All the

A replacement for the keyboard?

electronics are held on one small internal circuit board, and there are only a few moving parts. One is the teflon-coated metal ball which partially protrudes out of the bottom of the mouse casing. There are also the rollers, placed at right angles to each other, which translate mouse movements into x/y coordinates. The rollers touch the teflon-coated ball and move in accordance with it. Depending upon the skill of the user, such mouse-controlled movements can be made highly accurate - it doesn't take much time to be able to pick out a specific pixel with the cursor. Since the office environment poses a lot of potential hazards to mouse mechanisms — cigarette ash, abrasive paper fibres from lots of paper shuffling, and even the left-over debris from eat-in lunches abound - Apple has made its product user-serviceable. By unscrewing a black plastic retaining ring, the teflon ball can be tipped out and both it, and the mouse insides, given a clean-up.

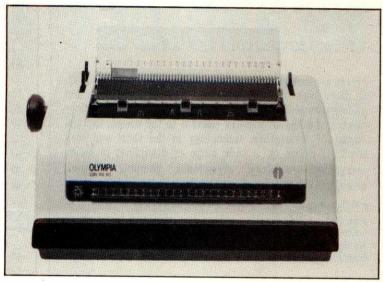

During this review, we found the mouse to be a truly natural method of interaction. The only problems were freehand drawing in the LisaDraw program and the fact that you had to keep your desktop neat — something managers may find difficult.

BEHAVIOUR & INFORMATION TECHNOLOGY

This new quarterly journal began publication in March 1982. It deals with the interaction of human behaviour and information technology, focusing on research and development in the human sciences relevant to the design, use and impact of information technology in the short and long terms. It draws on a wide range of disciplines including psychology, sociology, ergonomics, computer science, management science and economics.

Published quarterly, £37.00, \$90.00, DM175.00.

For further information and/or free specimen copy please write to the Marketing Manager, Taylor & Francis Ltd, Rankine Road, Basingstoke, Hampshire, RG24 OPR, England.

CONCORDIA THE EXPERTS

FOR YOUR

The simple to use QX 10 computer. Ideal for the first time user, it also has the power and facilities to satisfy the most demanding expert. The price includes CP/M, MFBASIC, twin double sided double density disk units, high resolution VDU, 192k RAM, a music generator

and interfaces for RS232, Centronic parallel, and a light pen.

Of course the QX 10 has 16 BIT precision, High resolution graphics, keyboard graphics, and many function keys. It also gives you 16 type faces to choose from and they all print out on the FX 80 printer.

on the FA Bu printer. In fact there are so many new facilities on the QX 10 and so many high quality programs to choose from that CONCORDIA have written a booklet to tell you about them.

To get one ring 01 337 4541 (Day or night).

sensors. If you want the disks back for some reason, you cannot just yank them out. To the right of each drive there is a disk request button which signals to the CPU that you want to remove a disk.

Before anything else is done, the Desktop Manager checks to see what files are open and then sets about closing them. Once everything is cleared from the desktop the disks are automatically ejected.

Having visited an office shortly after somebody lost 20 pages of WordStar text by removing the disks and resetting the system without doing the hallowed ^KD, I think there are many people out there who would consider the wait a reasonable price to pay as an insurance against going into a sudden state of speechless shock at losing an afternoon's hard work. And, anyway, what are you going to do with the disk if all your work hasn't been saved on it?

Documentation

During the review, provisional documentation only was available for use - the exception being a proof copy of the Lisa-Draw user's manual. The provisional material was more than adequate, but the LisaDraw manual — in fact it was more like a commercially published book was probably the best.

It was properly typeset on good quality paper and there were many photographs and high quality prints of the Lisa and its display to provide visual backup. Contents and page number information was also included. If all the documentation is of this quality, there won't be many complaints.

In addition to the manuals, Apple has written LisaGuide, an interactive guide on using the Lisa. It is quite a major achievement in itself since it avoids being condescending where it easily could be so. It makes full use of the display's highresolution and the mouse, so helping novices quickly through the acclimatisation

Service

Apple is offering various levels of service for the Lisa.

The ordinary user will be able to take advantage of the Apple Care Carry-In service whereby the machine is handed to a local dealer who will swop out the faulty part and replace it. Dealers will carry stocks to cover most component failures.

Bigger users can take out a contract with Apple whereby RCA will send a service person to the site.

At the top end, Apple will provide inhouse training so that Fortune 500 users can do all but the most major repairs themselves.

There is also a hot-line direct support service permanently available by telephone.

Discounts

Against the high single unit price of the Lisa, Apple is setting a series of discounts for customers prepared to sign 12-month contracts

If you are prepared to show a definite interest in buying a few machines over the next 12 months then you can gain a 10 per cent reduction in the cost price per machine.

Technical Specifications

32/16-bit Motorola 68000 running at 5MHz.

Other Processors: SCC chip in keyboard and NatSemi COPS on I/O board to

handle keyboard and mouse.

RAM: Presently 2 x 512k boards or the option of 2 x 1 Mbyte

boards - to be introduced shortly - that will fit in the same

64k start-up diagnostic code checks out disks, memory, etc.

Display:

Printers:

Diagnostic ROM:

Capable of generating audio backup if the display fails. Crisp, black on white background, video generation. 12 inch

diagonal, 720 x 364 pixels, bit-mapped in upper area of

RAM memory.

Keyboard: IBM Selectric style, 76 keys (no straight function keys) in-

cluding numeric pad.

Mouse: One button, see and point operation. Accurate for cursor

positioning down to individual pixels.

Floppy disk storage: Two 860k, 51/4in, floppy drives integral to system unit. Unique twin access windows in disk envelope because of offset

drive heads.

Hard disk storage: 1 x 5 Mbyte ProFile hard disk, as orginally designed for the

Apple III. More than one can be connected. Two RS232 ports, one parallel interface port.

I/O ports: Expansion slots: Three empty slots are available.

Desktop Manager operating environment, and six Lisa specific application programs: LisaCalc, LisaList, LisaWrite, System Software:

LisaProject, LisaDraw, and LisaGraph. Others, including LisaTerminal, will follow.

Languages: Basic Plus, Cobol, Pascal. Others are under development, incuding the Smalltalk language/environment.

Dot Matrix graphic printer (parallel) and letter quality daisy

wheel (serial) printers.

A customer which will commit to buying 275-549 units in the coming year can obtain 15 per cent discount. For 550-999 units the discount increases to 18 per cent.

At the top end, 1000 definite orders will yield a 20 per cent discount rising to 28 per cent for even greater volumes. International companies can gain these price reductions on a worldwide basis.

Prices

\$9995 (UK price around £8500) includes main unit, 1 Mbyte of RAM, display, system/applications software, keyboard, mouse, and 5 Mbyte ProFile hard disk unit.

Conclusions

Really to get an idea of what has happened. you mustn't compare the Lisa directly with other machines such as the IBM PC, the DEC Professional, or the Sirius 1. If you do the sums, they actually show that the Lisa is competitive in terms of price, and totally unapproachable in terms of integration (once all storage, software and necessary add-on boards have been accounted for).

Certainly, the recent announcement that Digital Research would be aiding and abetting Visicorp in implementing the mousecontrolled, window-oriented VisiOn product in the CP/M environment is significant. So too, is the fact that IBM, DEC and Texas Instruments have all said they will support the VisiOn package on their relative machines.

Microsoft, with its MultiTool word processing system, has also adopted the mouse as a viable alternative to laborious key-board commands. The product has windows, and is modelled after the company's Multiplan spreadsheet program.

Both packages will be moderately priced - a few hundred dollars each and this will obviously meet a vast number of users' needs. But consider that we're talking about different leagues here.

VisiOn and other similar products waiting in the wings, run on a range of manufacturers' machines that have not been optimally designed for such products. The keyboards are still the unhappy mixture of qwerty and dp functions; the mice are addons rather than a fundamental part of the computer's design philosophy; reliability in the software may not be mirrored by reliability in the hardware.

In summary, the hardware/software division is still maintained. Obviously, events in the next six months are going to provide some answers to such thoughts - but our feeling is that there is room in the market for both approaches.

SCREENPLAY

Maggie Burton looks at games software for the Colour Genie

The Colour Genie is a very puzzling animal indeed. Writing good software for it demands considerable expertise, especially in the area of machine code.

In the Colour Genie Benchtest last month I concluded that great things are possible from the Genie if software is properly written. The machine includes a very powerful sound generator, good screen handling in spite of the unchangeable low-res background, and the power to give very fine shape definition when user-defined characters are used.

Oddly, though, cassette handling is not as good as I had thought. It is only after spending a great deal of time playing with different programs from different manufacturers that you can begin to get an accurate idea of how well a machine loads cassettes.

Machine code programs load fairly well using the SYSTEM command to enter a rudimentary monitor (it seems to be designed purely for the loading of machine code). Basic is loaded using the more conventional CLOAD command. You are told when a program is loading by the appearance of two asterisks in the top right-hand corner of the screen. The rightmost one flashes as blocks of data are fed into the computer's memory.

Basic does not seem to load at all well. After much fiddling and swearing I was able to load just two Basic programs out of six — the others were abandoned when all the different volume levels had been tried. All of the cassettes were loaded from the Genie cassette recorder.

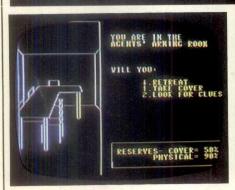

Loading is very error-prone; often the machine will load a program and run it even though the load is bad — the result is often chaotic, with odd characters appearing all over the place, controls refusing to work and screens filling with garbage. An error is indicated when the leftmost loading asterisk is replaced with a 'C'. Some machine code programs seem to cause unexplained corruptions when they are part-loaded. The most common was getting the response 'Syntax error' from the command NEW, even though the command worked. A lot of them disable the reset keys, making it impossible to empty memory without switching the machine off.

What is even odder is that the Genie seems to load better when it has only just been switched on. Once it has been running for an hour or so, and has got really warm, loading becomes progressively more unreliable.

Having now experienced the cassette loading/saving capabilities (or lack of them) on most home machines, there is only one thing which can be said. Almost without exception they are awful. This statement is not addressed at one manufacturer more than any other. Most

computers have some problems loading cassettes. The only one which rarely does is the Sharp MZ-80A, which has an integral cassette recorder anyway. While unsuccessfully trying to load programs I have often put myself in the place of the first time user. This person has proudly bought a machine and some software, gone home, set the machine up, and fiddled around for ages to get it tuned into the TV. Our unfortunate individual then decides to load his programs and try them out. He tries once. It doesn't work. He changes the volume level (if the manual tells him to, which some don't) and tries again. Eventually, after trying several times, not knowing how long to wait, not being quite sure what to expect, the program loads - by which time all the fun has gone from it. How many people, I wonder, have had that experience? It's a shame, in this age of microtechnology, that a better solution cannot be found than this.

The Genie software library is quite big. Most of the titles, unsurprisingly, are games. The seemingly impressive list of packages soon deteriorated into a very run-of-the-mill set of programs indeed. Some programs, though, are of a very high standard, as shall be seen from their reviews.

DOUBLE AGENT

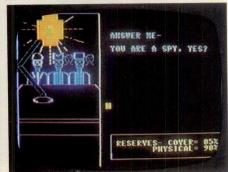

Supplier: Algray Software Price: £12.95

Fed up with traditional adventure games? Graphics? Sound? Role-playing? It's all here. Double Agent is positive proof that the Genie is capable of great things. It took me ages to load it like all the other games, but I wasn't at all disappointed. The plot is a very simple one. You are a double agent (one of 200 different characters, in fact, which you choose at the beginning of the game) in disguise, looking though a building seeking stolen documents.

In choosing your disguise you must consider your appearance and character so that you look the part. You are then entitled to carry some items as part of your disguise, which can prove useful later. You are also allowed to select some weapons from a short list, all of which will make your cover less convincing.

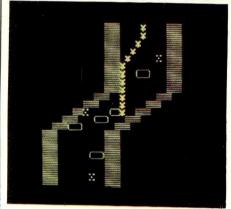

What is so good about this game is the graphic and sound effects. You actually walk around the building, open doors (or force them with a bang if they are locked), meet little men who look like traffic wardens and challenge you and discover objects which may or may not relate to

what you are looking for. You really feel as though you are the character you are playing. There is, though, what must be a bug in the game. If you turn left or right immediately at the entrance to the building, you become trapped in a location which probably should not exist and cannot get out. The screen becomes garbled and parts of the text are lost. The only way to get out of this trap is to restart the game.

On balance, though, old and young alike will love playing this game. It is well thought out and presented and is a definite step nearer to what adventures ought to be.

SCREENPLAY

RACING DRIVER

Supplier: Molimerx Price: £10.06

There are some really excellent Grand Prix programs around. Some of them are in 3D, other have lots of cars to control, bright colours, good sound effects. I mean no offence to Molimerx, but I've seen better games on a ZX81. Keyboard response is bad, shapes are poor, sound is boring and monotonous and all the graphics are in the same colour. The fact that it's in Basic is no excuse — the game is no good at all.

EXTERMINATOR

Supplier: Algray Software Price: £7.95

This is a very fast moving game indeed. Your aim is to destroy some birds while avoiding a deadly indestructible missile which zaps towards you at every opportunity. When you have done all this you go on to the second phase — grabbing eggs (while avoiding more aliens) and putting them in an incinerator.

It's not a very spectacular game at all but it does include a 'hall of fame' of the best five high scores.

ROCKFALL

Supplier: MCE Software Price: £5.95

Here's another (perfectly playable) game into which very little imagination has gone. The idea of the game is to catch Martian bombs (poor Martians — what have they done to deserve such a reputation?) and thus defend your cities. You do not fire or zap through millions of light years in time/space. It's a thoroughly two-dimensional game and a little too fast to be really enjoyable.

INVADERS FROM SPACE

Supplier: Molimerx Price: £9.20

We'd probably better resign ourselves to the fact that Space Invaders (to give a dog a name) is here to stay. It's a horrible old game but once it was really good, because it was the only video game around.

With so much computing power around it seems idiotic that software suppliers still go on producing version after version of this derisory little scenario.

What I will say here is that this version is as good as a version of space invaders can be. It is colourful, keyboard response is good and it is true to the arcade original — ie, it leaves nothing out. Interestingly it includes a facility to freeze the game and start it again. Using it you can often get out of difficult situations by freezing and then using one of the cursor keys to move out of the way

KONG

Supplier: Algray Software Price: £8.95

Before I review this game I'd like to say that gorillas are charming creatures; very gentle and far more civilised than humans. It is a little unfair that they are often portrayed as vicious, womanstealing, dangerous animals, but perhaps that's human nature.

Kong is also a version of an arcade game. Sound and graphics are very good but as far as I can see the game is nearly impossible. Basically, you have to climb up a building, avoiding the rocks the gorilla at the top will roll at you, and kill him with a hammer which you pick up at the beginning. Then you rescue the dame to win.

This is all lots of fun (apart from the abiding insult to the character of the gorilla) but sometimes you are killed for no apparent reason and you always die if

SKRAMBLE

Supplier: Algray Software Price: £8.95

Algray seems to have got the hang of it on this machine. Skramble is one of the games I played again and again, but it's by no means original.

It's a verison of the arcade game 'Scramble', and it's a very faithful one. It's also one of the few games which uses the Genie's excellent joysticks as an option. Those unfamiliar with Scramble will need to know that the game involves flying a little rocket over a varied landscape, killing alien ships and bombing fuel dumps until you fly through a long maze and come to a landing pad, where, logically, you must land to finish the game. It's a difficult game to play but lots of fun and quite picturesque.

This version is good but poorly debugged. You can explode on your own

DISKOGRAPHY

A BRIEF GUIDE TO FLOPPY DISKS

Jane and John Shemilt offer their advice on purchasing the correct disks for your computer.

This article is a short guide to the various types of floppy disk on the market and attempts to explain why it is important to buy the correct type of disk for your machine. It does not make any comparisons between disks from different manufacturers, so no 'best buys' are recommended.

There are two standard floppy disk sizes commonly in use: five and a quarter inch (mini) and eight inch (standard). Both these types have a similar construction, the heart of which is a mylar disk on which is deposited a metal oxide layer. The mylar disk is held in a sealed protective envelope with a soft inner lining including a cutaway for head access (see Fig 1). The disk has a large hole in the centre which fits onto the disk drive hub, which centres and rotates the disk inside the stationary envelope in the drive during use. There is at least one other hole in the mylar disk (the index hole) which lines up with the index/sector hole in the envelope once per revolution. If the disk is soft-sectored, there are no more holes in the mylar disk, but if it is hard-sectored it will have more holes in the disk which line up with the index/sector hole once each revolution. In this case, the disk is divided into sectors, ie, wedges or slices, by a series of holes (one hole per sector) in addition to the index hole. (Whether the division of the disk into sectors is hardware or software controlled will depend on the disk controller used by your computer.)

For eight inch disks, the index/sector hole in the envelope is in one of two positions depending on whether the disk is double-sided or single-sided while, for five and a quarter inch disks, the position of the index/sector hole in the envelope is always the same. The only other hole in the disk envelope of importance to the user is the write protect notch. Usually, on eight inch disks when the notch is uncovered, the disk may not be written to write protect mode, although on five and a quarter inch disks

this notch must be covered up by an opaque material to write protect the disk.

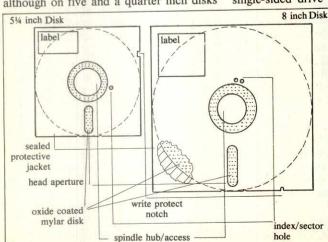

The label on the disk envelope usually has a large number '1' or '2' on it, followed possibly by a large letter 'D'. The number '2' indicates that the disk is double-sided, ie, both sides of the mylar disk have a metal oxide layer which can be written to, while a '1' denotes a single-sided disk. In fact, most single-sided disks are actually manufactured as double-sided where the oxide layer on one side of the mylar has failed on inspection. It is generally not a good idea to use single-sided disks in a double-sided disk drive as they can cause damage to the magnetic recording heads if used frequently. However, double-sided five and a quarter inch drives can be used on single-sided five and a quarter inch drives, but only as single-sided disks and the second side of the disk may be damaged if it is used this way frequently. It is possible to buy doublesided disks with two index/sector holes in the envelope so that both sides can be used, but only one at a time, in single-sided drives by turning the disk over to change sides. Unfortunately these disks, when turned over, rotate in the opposite direction to their previous motion so that all the dirt and loose oxide particles, which have collected on the liner by the side of the head access slot, are dislogged and deposited on the disk surface. This debris is wiped off on the recording head and pressure pad of the disk drive and can cause damage. Also, in this case, the pressure pad on the single-sided drive is in contact with a disk surface, which is used for writing to and reading from, and can damage this surface leading to the loss of data on the disk; usually the pad presses on the unused face of a single-sided disk.

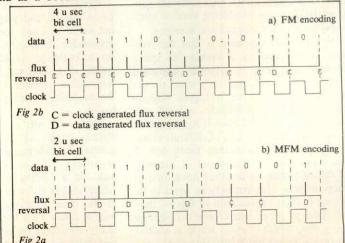

Another special eight inch double-sided disk can be obtained where both the single-sided and double-sided index/sector holes are cut out in the envelope, so that the disk can be used as a single-sided disk on a single-sided drive and as a double-sided

disk on a double-sided drive. Of course, the index/sector hole which is not applicable should be covered up while using the disk. The main use of these special disks is in the transfer of software between different disk drives but, as most eight inch double-sided drives will also read and write to single-sided disks, these make a more readily available medium to transfer software.

The disk label also specifies the recording technique for which the disk is suitable. The standard recording technique of Frequency Modulation (FM) records a flux reversal on the disk at every clock pulse (4 microseconds) to produce bit cells. The data is recorded serially in the form of another flux reversal in the centre of the bit cell to record a '1' bit or no flux reversal for a '0' bit. (see Fig 2a). A disk capable of being used with this recording method is called a single density disk. In order to double the amount of data stored on the disk, a technique called Modified Frequency Modulation (MFM) is used. In this method (see Fig 2b), the clock frequency is doubled giving a 2 microsecond bit cell. However, there are normally no flux reversals recorded on the disk at clock pulses so that only data generated flux reversals (denoting '1' bits) are recorded. This could lead to synchronisation problems if a group of '0' bits happened to be recorded in sequence and, therefore, if one '0' bit is followed by another '0' bit a flux reversal is inserted at the clock pulse (see Fig 2b). Disks suitable for MFM recording are called doubledensity disks. The actual frequency of recording in MFM is not increased over FM (single-density) technique but this double-density recording is more susceptible to the quality of the disk. A doubledensity disk may be formatted and used in a single-density drive but a single-density disk should not be formatted for doubledensity as it is prone to errors. (In practice it is often possible to get away with formatting a single-density disk as a doubledensity one.) The letter 'D' following the '1' or '2' on the disk label implies that the disk is of double-density quality. Even though the recording technique used by a machine may not be FM or MFM, the disk type specified for use on the particular machine will be specified as 'single' or 'double' density.

For eight inch disks that completes the story but, for five and a quarter inch disks, there is one more option to consider when GOTO page 240

word processing + accountancy + financial modelling + calculation + record keeping + sales office management + accounts + payroll + graphics + engineering + communications + languages + solicitors + CAD

ECALC FOR EPSON

Mike Liardet takes a look at ECalc — a spreadsheet system for the Epson HX-20.

In the last three years Epson has achieved an extremely good reputation as a hardware manufacturer with its highly reliable range of printers for micros. More recently, it has joined the growing band of Japanese companies exporting micros to the West.

The first of its micro product line to arrive in the UK was the HX-20, a portable computer only slightly bigger and heavier than this magazine (reviewed in December 82 PCW). This has now been joined by the QX-10, a more conventional desk-top micro (reviewed in this issue) running CP/M.

True to the industry norm, the HX-20 arrived on the scene to great acclaim, but with very little software to run on it. Now six months on, a trickle of software is becoming available, including a word processor called Intext, and ECalc, a spread-sheet system which is the subject of this article. To date, all Epson's offerings have served to reinforce the excellent Japanese reputation in electronics manufacturing. Now we have a first opportunity to see if it has software skills to match.

Back to Basic(s)

My complete review package, including all hardware, software and manuals, arrived in a neat cardboard box about the same size and weight as a briefcase. In fact, if you are not image-conscious, you could just about use it as a briefcase, since Epson has thoughtfully fitted a rugged plastic handle to the top.

Quickly opening it, I unearthed the HX-20 itself, with a mains adaptor, microcassette drive, two manuals and, of course, the ECalc package.

The first task was to fit the microcassette drive. Once fitted, it becomes an integral part of the body of the HX-20, with no trailing wires or other encumbrances. The cassette is actually held in place by a clamping lever, and there is absolutely no need to fiddle with screwdrivers or jackplugs, or get involved in any wiring-up. The whole operation takes less time than I have taken to describe it!

As the HX-20 comes supplied with a rechargeable battery, it is not necessary to

use the mains adaptor. The battery is reputed to run for 50 hours without recharging. Since the adaptor did not have a mains plug, I opted to 'leave it for the time being'. I subsequently regretted this, when the battery died on me at a critical moment in the Benchtests, and long before 50 hours had elapsed. Presumably it was already greatly discharged when the system arrived. Anyway. I was able to resume work immediately the adaptor was connected, since it simultaneously powers the machine and recharges the battery. In spite of the power failure, the Epson had managed to retain the ECalc software in RAM, but I was unable to recover the spreadsheet model itself, and had to re-enter it all.

The ECalc package is attractively presented in a shiny blue paperback-sized box, holding the micro-cassette and slim spiral bound manual. (ECalc is also available, at a greater price, on a ROM cartridge.) Both the box and manual cover label the package 'Epson Calc' (for the sophisticated punter at the Derby?!), but the software and documentation refer to it as 'ECalc'. Presumably the marketing and technical departments have got their wires crossed on this one.

Before doing anything, I had to get the software on the micro-cassette read into the machine. In fact, once there, it stays almost indefinitely, surviving all switch-offs and low battery levels, somewhat lessening the advantages of the ROM cartridge. Of course it can always be explicitly erased to make room for another program perhaps,

and also it does get lost if you remove or really abuse the battery.

Anyway, I experienced a few initial difficulties loading the cassette, although it is actually a fairly straightforward procedure once you know what to do. Firstly, my review copy was unlabelled, so I was unsure which way to insert it in the drive and my initial guess turned out to be wrong. Further confusion arose when I missed a vital bit in the ECalc manual telling me that the HX-20 must be in Basic programming mode before the cassette drive commands However, operate. consulting the programming and hardware manuals and applying a bit of guess-work, I got the cassette drive reading the tape.

After a minute or so, I was informed of an 'I/O error', usually a sign that the tape or cassette drive is duff, though the ECalc manual had nothing to say on this matter. Trying again, I got the same message, and then — on my third attempt — it worked! Subsequent experiments failed to repeat the I/O error, so possibly it was caused by a speck of dust on the tape. Whatever the cause, the manual had no advice on the matter.

Having successfully read the tape, I still did not have an up and running spreadsheet system, being in Basic programming mode. Eventually I tracked down the instructions in the ECalc manual. It transpires that it is necessary to type RUN to get ECalc going. This is the usual command to run a Basic program. Could it be that ECalc is written in Basic? Well, somewhat to my surprise, I

Benchmarks and other measurements

Maximum number of columns: 14 (26 with 16k expansion unit).

Maximum number of rows: 15 (35 with 16k expansion unit); numeric precision: 7 digits; fixed column width: 8 characters.

As mentioned in the article, the formulae used in the Benchtests were slightly modified to comply with ECalc's formula syntax requirements. (Refer to PCW's Feb '83 issue for more information on these tests.)

Benchmark 1— to test calculation speed and capacity: (a) 9 rows (b) and (c) both 450 seconds, ie, 50 seconds per row (d) vertical scrolling speed: 18 seconds for 9 rows, ie, 2 seconds per row. Horizontal scrolling speed: 30 seconds for 13 columns, ie, 2 seconds per column.

Benchmark 2 — 15 rows (this fills every single cell with text).

Benchmark 3 — 15 rows (this fills every single cell with numbers).

Cassette benchmark: the 9 row calculation benchmark took 90 seconds to save, approximately one cell per second.

verified that it is. Basic, with its comparatively slow speed of execution is not normally the preferred language for implementing time-critical spreadsheet systems. The benchmark timings (see below) testify to this.

Putting it in perspective

The original motivation for spreadsheet systems was to provide a facility to help with pencil/paper/calculator operations. They ran on expensive (compared to a calculator, that is) micros. Although in one

extraordinarily cheap and portable computer, we can also view it as a rather large and expensive super-calculator. Thus ECalc is one of the first of, what I expect will become, a growing number of inexpensive calculator spreadsheet systems — taking the spreadsheet back to its roots.

It must be remembered that any spreadsheet system on the HX-20 is bound to be limited by the small screen display available: only 20 characters across by four rows down. Similarly the standard HX-20 comes with just 16k of RAM to hold both program and spreadsheet data.

program and spreadsheet data.

Both of these hardware facts of life contribute to the attractive price and portability

of the machine but also offert

tication of the software written for it. So it's really within this context that we must look at what Epson can provide.

Using ECalc

Once ECalc is running, the display clears to reveal the top-left hand corner of an empty spreadsheet. Just four spreadsheet cells can be accommodated in the display, two columns by two rows. The display's left-hand margin is reserved for the row numbers, and the top row has the column identifiers (letters A,B, etc). Thus ECalc uses the standard 'Visicalc style' for identifying cells on the spreadsheet; the first row of cells being A1 B1, etc. and the second

ECALC

being A2, B2, and so on. Of course, the display has no room for long-winded prompts, or copyright messages. The fourth and bottom line of the display are left blank, being used as 'input lines' displaying what has been typed at the keyboard. Fig 1 gives an actual size (with respect to character count) typical display.

Moving around the spreadsheet is very simple. The 'current cell' is marked by an underline cursor character. In fact this is redundant since the current cell is always the top left-hand cell on display. Anyway, the keyboard has two keys each labelled with two arrows, and each pointing in a different direction. Using these keys with and without the 'shift' key provides the four different key strokes necessary to move the current cell to the one above, below or to left or right.

After each keystroke the display is redrawn, so that the newly current cell appears in the top left hand position. The display is liquid crystal, and 'redraws' are slower than a video display would be, but because it's a small area being redrawn, this does not greatly inhibit the speed of moving around the spreadsheet.

Moving far enough to the right and down we reach the outer limits of ECalc's spreadsheet: 14 columns wide by 15 rows down. This is quite a small area but, unlike many spreadsheet systems, this is not simply a theoretical limit, since in most cases each and every one of these cells can be used without running out of memory. (In fact only the 'formula Benchtest 1' filled up all available memory before all the cells had been used.) The HX-20 also has an optional 'expansion unit', with another 16k of memory, which extends the limits to 26 columns by 35 rows. As the review system

did not have the extra 16k, I have only tested the smaller size spreadsheet.

Entering text, numbers and formulae follows the standard drill: move to the cell to be changed and type in whatever is required. To enter a formula, first press the '@' key to select 'formula mode' or else it will be treated as ordinary text. Similarly, numeric input is preferable in formula mode, since then the formatting is handled automatically. Formula syntax is rather more limited than usual: only simple arithmetic (+ - * /) can be used, and no parentheses. For some formulae this involves a little extra thought. For example, one formula used in the Benchtests (see PCW, Feb 83) is: (12*(A1-1)/12)+2. For ECalc this had to be converted to: 12*A1-12/12+2. Note that ECalc evaluates from left to right, ignoring the normal algebraic precedence conventions. For example, ECalc would evaluate 3+4*5 as 35 and 4*5+3 as 23. It is easy to work out what is happening if you (mentally) add parentheses from left to right: (((12*A1)-12)/12)+2, (3+4)*5(4*5)+3 in the examples I have given.

ECalc does not automatically recalculate after every entry. This has to be forced by pressing the 'recalculate' (control-R) key, but once pressed the spreadsheet is completely updated to reflect all changes. However, recalculation is probably the weakest aspect of the system, since it takes an excessively long time, even for quite small spreadsheet models (see Benchtests below).

Other features

Apart from the basic facilities described above, ECalc has the following features: * Row and column totals. The last column and row of the spreadsheet can be used for row and column totals. This compensates somewhat for ECalc's lack of SUM function, available on most larger spreadsheet systems.

Checklist

Documentation: attractively packaged 32-page manual with tutorial, reference

User-friendliness: relatively easy to use, but slow calculation speed, and

limited help prompts.

Error handling: a few terse error messages.

Facilities: +-* / row and column sum. Can be configured as a turnkey system. Replication into rows or columns but not areas. Only three display formats: integer, two decimal places and exponential. Fixed column widths. Manual recalculation only. 'GOTO' cell facility.

Supplier and prices (exclusive of VAT): £30 on cassette (and cassette drive costs £75). £85 on ROM cartridge. 16k memory expansion unit costs £75 and the HX-20 itself is £402. Contact Epson (UK) Ltd, Freepost, Wembley, Middlesex HA9 6BR. Freefone 2730.

* Display format control. The numeric display can be either integer (ie, no decimal point) or decimal (a decimal point and two digits after the decimal). The format control is global and cannot be used selectively on specified cells. In either format, very large numbers are displayed in 'exponential form', for example, 123456789123 is displayed as 1.2E+12.

* Replication. Formulae, numbers and text can all be replicated along a single row or column, but not into an area. Specifying replication into an area (an area would be 'A1 TO F6' whereas a row would be 'A1 TO F1') produces a terse error message:

2D NO GO.

Replication of formulae can be in both relative or absolute mode. Absolute replication copies the formula faithfully, and relative replication modifies it according to where it will be placed. Relative replication is used when a formula has been set up to calculate, say, January profits, and it's to be copied along the row, into February to December columns. Clearly references to January cells in the January formula should become references to February cells in the February copy, and so on. Relative replication ensures that this happens.

Another nice feature of replication is the ability to move the cursor in mid-formula entry. As only four cells are on view at one time, it is easy to get confused when entering a complex formula. By moving the cursor the required cell can be located, then simply pressing '@' enters its identifier directly into the formula.

* Printing. The HX-20 comes complete with an integral printer, using cash-till roll paper, and also an interface for an external printer. ECalc provides facilities for printing a specified area of the spreadsheet to either. The integral printer can only print 24 characters across: enough for just two columns of the spreadsheet, and wider reports are automatically broken into sections by the program, two columns at a time. For such a small device the printer is surprisingly noisy, and would doubtless cause a bit of a stir when used in a public place. Needless to say, being an Epson, the print quality is very good.

Saving and loading data. ECalc provides a fairly sophisticated cassette filing system. Before loading, the tape can be fast-wound (all under program control) to a numbered position, thus reducing search-times. Spreadsheets are saved with an eight character name, so it's possible to save more than one per side of tape, without getting them mixed up. And every time a save is made, the program prints out its position on tape with its name and the date, providing a hard-copy record for future reference. (By the way, the HX-20 has its own clock with calendar software, so it's not necessary to enter the date every time you use it.) Saving one of the benchmarks, just over 100 cells of 13 character formulae took 90

Missing features

speed for a cassette.

It should be clear by now that ECalc is a fairly simple spreadsheet system. Of course it lacks consolidation facilities, split

seconds, which seemed a fairly respectable

screens and other sophistications, but these are hardly fair criticisms for a package in this context, so I will not dwell upon

However, it does also lack a few features of basic human engineering which, if present, would greatly contribute to userfriendliness. For example, there is no command to clear the spreadsheet, and there are no instructions on how to do it, either. In fact the spreadsheet can be fairly quickly cleared by exiting then re-running, a matter of a few keystrokes. Another source of annoyance was that it was impossible to abandon a menu option once selected, for example, once replication is selected you must go through with it, even if you hit the wrong key by accident. Also for some reason, the delete key did not operate in text entry under the menu options.

Although it is difficult to run out of memory before every cell available is in use, it would appear that there is no proper error-recovery if this does happen. When running the calculation benchmarks, the system simply 'died' if too many formulae were entered.

Of course more extensive arithmetic and faster recalculation times would also be desirable, along with improved editing facilities and row and column deletes. Particularly lacking was a flexible formatting facility. If working with small quantities it could be possible to squeeze four or five spreadsheet columns onto the display, but with ECalc's fixed column widths there is no facility to do this. Obviously, with just 16k of RAM, the implementors had to draw the line somewhere, since lots of facilities would mean no room for spreadsheet!

ifie manual

The manual is well presented: 32 glossy pages with information on getting started,

basic facilities, several tutorial examples and an index. Most of the instructions give a key by key account of what to do with all the keystrokes given in emphasised type, and keystrokes using special keys (like 'control' and 'return') printed in inverse, white on black. This is not quite as effective as it could be since emphasised type is also used wherever the product name appears, and in other instances as well. Thus it is still necessary to hunt through the text for which keys to use. Most of my initial problems with cassette loading stemmed from being unable to find information that was actually there, but obscured by inconsistent type-

The content of the manual is passable, but not as clearly written as I would have liked. Possibly it lost a little elegance in its translation from Japanese, or alternatively it's always been in English but was not brilliantly written in the first place! Certainly it's better than some Japanese translations, in fact better than Epson's own printer manuals, but I did find it necessary to re-read most of the instructions before I could mentally digest them.

There are several tutorial exercises, including a December cash-flow problem. for a certain Mr Fawkes of the 'Big Bang Firework Co' — a refreshing change from the 'Acme Widget' example that seems to pepper most of the American manuals.

Conclusion

Frankly, I was a little disappointed with ECalc. Of course, knowing the hardware limitations of the HX-20 I was not expecting a product in the Multiplan class (reviewed in PCW, April 83), but it would not be going into the realms of fantasy to expect a greater range of arithmetic functions and a more respectable calculation speed. After all, the HX-20 does have an

excellent Basic interpreter written by Microsoft — fully equipped with all the usual trigonometry and arithmetic functions. So all that software is already there, just waiting for connection to a spreadsheet system, and Epson failed to make use of it.

Curiously enough, I was not greatly troubled by the small scale display. Obviously a bigger display would be preferable, and Epson have plans for an external 32 by 16 character add-on, but it certainly did not render the system unusable. A particularly nice feature was the ability to move the cursor during formula entry, thus enabling the right cell reference to be found even if it was off-screen at the start of the formula entry.

The integral narrow width printer (24 characters) was just about adequate to the task, but a fair bit of cutting and pasting would be needed to fit together a wide report. As compensation, the HX-20 has good facilities for connecting to larger external printers and ECalc itself can optionally make use of them.

After some initial teething troubles the cassette behaved itself very well, with some fairly sophisticated facilities for loading and saving the spreadsheets, and at quite a reasonable speed (for a cassette) as well.

So all things considered, Epson have succeeded in implementing a usable spreadsheet system on their hand-held portable computer. It's a system that can support only fairly lightweight applications, partly because it's on lightweight hardware (for which the implementors cannot be blamed), and partly because of the software design (for which they can). Nonetheless, hand-held micro owners are not exactly spoilt for choice in this area at the moment, and so ECalc should prove of interest to the growing band of HX-20 users beavering away on buses, planes and trains.

NUMBERS COUNT

Mike Mudge presents another batch of mathematical mind-benders.

n-TUPLES OF ASSOCIATED n-TUPLES

A triple of positive integers is defined to be (a,b,c) where a, b and c are chosen from 1, 2, 3,... The order of occurrence of a, b and c is not significant.

Two such triples are said to be associated if they have a common sum a + b + c and also a common product a x b x c. We shall write, for example, (14,50,54)(a)(15,40,63) since 14+50+54=15+40+63=118 and 14x50x54=15x40x63=37800; (a) being read 'as associated with'.

Computational problems

Determine the smallest common sum of four associated triples. Believed to be 118.

- (ii) Determine the smallest common product of four associated triples. Believed to be 25200.
- (iii) Discover quintuples any associated triples. (6,480,495)(a)(11,160,810)(a)(12, 144,825)(a)(20,81,880)(a)(33,48,900).
- (iv) Investigate empirically the existence of larger sets (n-tuples n > 5) of associated triples.
- Investigate empirically the existence of n-tuples of associated m-tuples for computationally feasible m and n.

Note: There are mathematical problems relating to infinite families of associated triples such as:-

(16ka,bc,15d)(a)(10ka,4bc,6d)(a)(15kb,a $d_{16c}(a)(6kb,4ad,10c)$ where a = k + 2, b = k + 3, c = 2k + 7, d = 3k + 7, k =1, 2, 3, ... due to J G Mauldon but these are essentially outside the scope of this article.

Readers are invited to submit a program, or suite of programs, which invesabove problems. submissions should include program listings, hardware descriptions, run times and output; they will be judged for accuracy, originality and efficiency (not necessarily in that order). A prize of £10 will be awarded to the 'best' entry received.

Entries, to arrive by 1 September, to: Mr M R Mudge BSc FIMA FBCS, Room 560/A, Department of Mathematics, The University of Aston in Birmingham, Gosta Green, Birmingham B4 7ET.

Note: Submissions will only be returned if suitable stamped addressed envelopes are included.

EPSON QX-10

Having made its name as a printer manufacturer, Epson took the world by storm with its portable micro, the HX-20. Will its desk-top machine have a similar impact? Peter Rodwell investigates.

Epson makes more dot matrix printers than all the other manufacturers put together and has an enviable reputation for producing well-made and reliable products. As well as selling its printers under its own brand name, it seems to have done deals with nearly every big name in the micro world to supply printers in any colour or casing with anyone else's name on the outside — even IBM uses Epson printers for its PC.

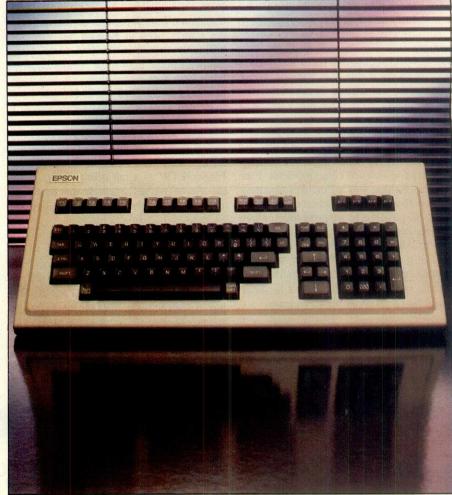

As part of the giant Seiko electronics group, it was perhaps inevitable that Epson would develop its own computers and this it has done, achieving an instant success with its HX-20 portable machine. The QX-10 is a 'grown-up' desk-top microcomputer which has already been available in Japan and the USA for some time but which has only just appeared in this country. It received rave reviews in the States and I'll say right now that this review will be of the same ilk — it's a nice machine.

Another thing which must be said right at the start is that the QX-10 goes completely against the current trend by being an 8-bit microcomputer, not 16-bit. But this is no ordinary, boring Z80based, twin disk, CP/M-based machine. Yes, it's based on a Z80; yes, it has twin disks; and yes, it's a CP/M-80 machine, but unlike just about every other micro in this category, there's a lot more to it than this. Epson must, of course, be working on a 16-bit desk-top micro (it will certainly bring out a 16-bit portable before too long) but in the meantime, apparently dissatisfied with the state of 16-bit computing, it has chosen to put a lot of careful thought and ingenuity into considerably refining and developing the good old 8-bit formula.

On the printer front, Epson has enjoyed resounding success with its MX range of dot matrix printers. These have now been replaced by two new machines, the RX-80 and FX-80; the latter offering all the features of the top-of-the-line MX-80 but with plenty of extra bells and whistles, too. It seemed logical to evaluate this new printer at the same time, so you'll find a Checkout of it tacked onto the end of this Benchtest.

Hardware

The QX-10 follows the now conventional 'three box' design philosophy, which allows the user to devise whatever

Light, positive - and 103 keys!

relative positioning of screen and keyboard is most comfortable.

The main box houses the electronics and disk drives and, at 510mm wide by 340mm deep, is roughly the same size as an IBM PC box; it is, however, much lower, at 100mm or so, and this is achieved by the use of two low-profile disk drives. The box is in fact very slightly higher than the FX-80 and slightly less deep.

Apart from the disk drives, the only features on the front of the box are a small power light, a reset button deeply recessed into the lower edge of the moulding, and the socket for the keyboard cable, similarly hidden. The power switch is on the right hand side towards the back.

The rear of the machine has quite a few holes in it. From left to right, as you look at the back, these are: power connector, light pen socket, a socket carrying video and power for the monitor, a row of DIP switches which configure the system's RAM, a tiny volume control knob for the internal speaker, a parallel Centronics printer interface, an RS232 interface and a series of snap-off plastic covers — the purpose of which we'll come to soon.

The keyboard unit is the same width as the main box but is only 50mm high. It connects to the main unit through a neat, coiled cable and recessing in both units allows you to push the keyboard right up against the main box, with the cable neatly hidden, out of the way. The 103 keys have a very light but positive feel, just right for very fast typing. All the main alphanumeric keys auto repeat if held down for more than a second or so. Across the top of the keyboard are ten programmable function keys, a block of four keys labelled 'Break', 'Pause', 'Help' and 'Screen dump', the functions of

which are exactly as stated except for the Help key, which merely produced the characters 'A@' on the screen. There are another four keys, each with a built-in LED indicator, labelled 'SF1' to 'SF4' at the right hand top of the keyboard; these allow you to alter the character set, as we'll see later. The main qwerty block is standard, but has a caps lock key with built-in LED at one end of the space bar and a graphics shift key at the other. This graphics key allows you to type in graphics symbols directly from the keyboard, using the main alpha keys; the symbols provided include the usual lines, boxes and shades as well as a little person, a tiny car, an unstable-looking aircraft and a half-full wine glass. There's also an odd one which may or may not be a telephone receiver.

screen clear, insert and delete keys. At the far right is a numeric pad which includes a return key, all arithmetic symbols and a '000' key. All the main keys on the keyboard are a tasty plain chocolate brown, with subsidiary keys a lighter colour. And - a nice touch - the 10 function keys and the Break, etc, keys have removable transparent covers so you can put your own labels on them. It can surely be only a matter of time before Epson — or a similar company produces function keys with dot matrix LCD displays built in, so that key labels as well as functions can be changed under software control.

The keyboard can be used in two positions - lying flat on the table top or tilted up by pulling out the two rear feet and turning them to lock them into the

around but there's no way to adjust its tilt, which is a little odd although, in practice, I found it to be at the right angle anyway. Both power and video signals are carried along the same rather short cable. The only user control on the VDU is a brightness knob at the back although there's also a deeply recessed focus adjuster, for which you need a long screwdriver. The display is monochrome with sharp, green characters on a black background.

Overall, the QX-10 looks neat and stylish and takes up commendably little space on the desk. It's not too heavy 18kg, in fact - to move around the office, either.

A closer look at, and inside, the main box shows that the machine is built to the very high standard we have come to

EPSON QX-10

left of the main box as you look at it from the front. Inside, you have easy access to an area of the main PCB where all the RAM chips are housed - there are two groups each of 64k on the standard machine and sockets for another 64k to be added. And there are five sockets for expansion cards, one of which was occupied on the test machine with the multi-fonts card, supplied as standard equipment in this country. Each expansion card fits into a slot at one end and has a small 'foot' which engages in a hole in the PCB at the other, thus holding it perfectly steady, unlike the free-flapping arrangements found in some other machines. At the rear of the case is a panel of four snap-off covers which can be replaced by connectors for the expansion cards and there's also a tiny plastic cover hiding a DIN-sized hole for a connector to the fifth card presumably this would be for something like a colour monitor connector.

Two screws are visible inside this area: they obviously hold down the rest of the cover, but at first sight there seems to be no access to the remaining cover screws. A closer inspection reveals two tiny plastic removable squares on the cover top; levering these up with a screwdriver reveals the other two cover screws, an impressively neat piece of design work. The two disk drives are fixed into the cover itself and with their leads unplugged — two easy-to-get-at connectors and an earthing strap — the

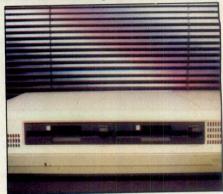

whole lot lifts off. Inside, there's a vertically-mounted power supply at one end of the machine and the whole of the rest of it is taken up with a gigantic PCB, crammed with components and beautifully made. Crammed though it is, though, there still wasn't room for everything and another, smaller board is piggy-backed on top of it. The standard of construction is very high and could act as a lesson for quite a few European and American manufacturers: everything is neatly arranged, there are no wires floating around, all the important chips are socketed and the whole thing has clearly been designed not only for efficient manufacture but for easy servicing, too.

The CPU chip is in fact a Japanese Z80A equivalent, a uPD780-1. The system contains a DMA controller, two counter-timers, a clock/calendar chip with battery back-up, Centronics parallel, RS232 serial and light pen interfaces and five expansion card slots — expansion cards can be inserted in whichever slot takes your fancy.

The system comes with 192 kbytes of RAM as standard, expandable to 265k. A 64k area is designated as the main bank and operates just like a normal CP/M-based system — see the Memory Map. Another bank, of 56k, is labelled 'BIOS' in the manual and appears to be reserved for the expanded CP/M used in the machine. Two further 56k banks are also available; Bank 1 comes with the standard machine and is used by the Multi-font Basic or can be accessed from CP/M as a 56k capacity memory disk called Drive F. You can use this just as

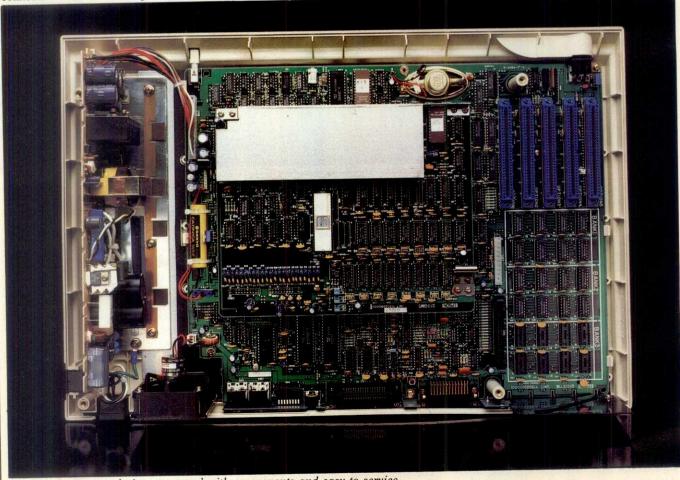

Rear view with snap-off covers

Low-profile disk drives

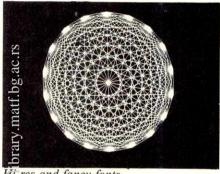

Expansion sockets.

Interior shows neat design: crammed with components and easy to service.

Hires and fancy fonts.

though it were an actual disk drive, and expanding the memory to the full 256k gives a second RAM disk, designated Drive E, also of 56k capacity.

A further 32k of video RAM is provided and a diagram in the manual seems to suggest that this can be expanded to 128k, although nowhere is this mentioned in the text; I assume this refers to the colour display option. The screen displays 25 lines of 80 characters normally, each character being formed on a 7 x 13 matrix. Curiously, the standard character set has virtually no descenders but is nevertheless very attractive and easy to read descenders in fact project below the line by a single dot. Using MFBasic, you have either 20 lines of 80 characters or 20 lines of 40 characters - the latter being used for the fancy fonts. Graphics resolution is a very good 640 dots horizontally by 400 vertically.

The QX-10 system diagram in the manual also shows 2 kbytes of CMOS RAM with battery backup, although its purpose isn't very clear from the manual.

The double-sided, double-density 5¼in real disk drives have a formatted capacity of 278 kbytes per disk after the directory and operating system have taken their share of disk space; this is fairly low by today's standards.

In use

Setting up the machine is simplicity itself - insert the power lead, plug in the screen and keyboard, and you're ready to go. Switching on produces a quiet rushing sound from the cooling fan and the words 'INSERT DISKETTE' appear in the centre of the screen, with the LED on the left-hand drive lighting up to indicate which drive expects the disk. The low-profile drives are very, very quiet and hum slightly while the head is being moved across the disk. The QX-10 appears to go through some sort of diagnostics or configuring routine initially, which involves flashing all the LEDs on the keyboad, one at a time and then all together in a most festive manner. This all takes several seconds, during which time nothing appears on the screen to tell you what's happening, but eventually you get the CP/M copyright sign and prompt.

System software

The QX-10 comes with a considerably modified version of CP/M-80 2.2, allowing complete control over all of its fancy features. At boot-up, the 10 function keys are configured to provide all the most useful CP/M commands at a single keystroke: DIR, TYPE, LOAD, DDT, PIP, DUMP, SAVE, SUBMIT, and MFBasic.

Most users will probably want to customise the system's configuration first, though, using the CONFIG program. This alters the system configuration information held as a file on disk and read during the boot-up process. It allows you to set up the machine for any of Epson's printers but there's no option to allow you to specify another manufacturer's printer which are assumed to be attached to the parallel port. The options included all the MX and FX models. The serial port can be set up for baud rates from 50 to 9600 and for all the usual framing possibilities (number of stop bits, parity, etc). If you need faster serial communications, you'll

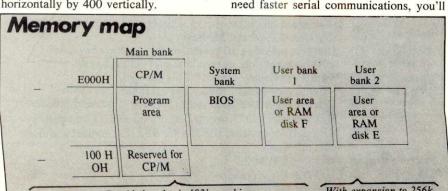

have to install an option serial card which allows baud rates up to 19,200 baud. CONFIG then allows you to set the date and time for the clock/calendar chip before offering you a choice of eight 'language' options, which are in fact the possible character sets: standard ASCII, French, German, English, Denish (sic), Swedish, Italian or Spanish. Keyboards are available to use all of these characters, by the way, another lesson many Americans could learn.

A utility called CHARADEF allows you to create your own character sets of up to 66 characters and store them on These can be accessed by applications programs and displayed on the screen, and provided you are using a suitable printer, they can also be printed out. The function keys can be reprogrammed using a utility called PFKSET; this allows whole strings to be assigned to each key and files of these stored on disk. You can modify the table of strings used by the machine as standard settings and you can create your own tables; these can be loaded from disk and activated with the same program. This can happen automatically, if required, using the AUTOST program, which allows you to define a program for automatic execution when the system is turned on.

The QX-10 can be used as either a terminal to another computer or as a host computer with the TERM program. You can also alter the RS232 port settings with this utility. This would appeal to owners of both a QX-10 and an HX-10; the latter could be used 'in the field' for data collection, and the data could then be loaded into the QX-10 back at the ranch.

Other utilities, apart from the standard CP/M ones, include DISKCOPY, which transfers the entire contents of a disk from one drive to another and which can also be used with the RAM disks; FORMAT, which formats a disk; and DIRINIT, which initialises the directory of a disk and, effectively, erases anything on it in the process — this is useful for cleaning up the RAM disk after MFBasic has cluttered it up.

Some very considerable extensions have been added to those already in CP/M These are concerned with handling, dumping the screen's contents to a printer, serial port handling (both the built-in port and extra ones), reading and setting the clock/calendar chip, using the light pen interface, handling interrupts and the function keys and dealing with the memory system. This last includes routines for switching between RAM banks, transferring data between banks and using software at a specified address in a specified bank. These will all provide hours of harmless fun for the serious assembler language programmer but of course mean that any programs using them will be totally non-standard and unusable on other CP/M-based machines. This shouldn't be too great a discouragement, I feel. One would expect any sensible programmer to have long ago built a good degree of adaptability

PSON QX-10

the advanced features now appearing on CP/M micros, and to have catered for the inclusion of these sorts of facilities in his software.

Character fonts

The OX-10 can display 16 different built-in character fonts, a feat unrivalled by any other CP/M-80 micro as far as I am aware. Yes, there are machines around which will allow you to generate your own fonts but none, to the best of my knowledge, come with them built-in, not only to the system but to the operating system, too, so that using them is actually easy.

The hard work is done by the MultiFont character generator card, supplied with the standard machine, which occupies one of the expansion bus slots. The card contains six 128 kbit ROMs full of character data and has its own 8-bit 8039 slave CPU, plus control firmware in a 2716 PROM.

A utility program, MFONT, activates the card from CP/M. You can then select whichever font you require with the four 'SF' keys at the top right of the keyboard. Fonts are selected by pressing these keys in various combinations, the activated combination being shown by the little LEDs built into these keys. have With four keys vou combinations plus the standard one used by the system normally. The penalty you pay for typographical fun and games, though, is that you can only display 40 special characters per line with these fonts, instead of the 80 per line with the standard character set. This is a shame, for one or two of the fonts are much more attractive than the standard one and come with normal and italic versions, which would look nice for word processing. Most of the fonts are, however, decorative rather than practical and you would only want to use them for headings, etc, rather than whole blocks of text. Needless to say, the font generator can be controlled by CP/M applications programs, through what seems a complex series of commands; time just didn't allow me to experiment with this facility and I confined my font fun to playing with it from Basic instead.

My immediate reaction to the fonts facility was that it would make a superb tool for layout artists, but although the manual speaks of proportional spacing possibilities, I couldn't quite work out how it could be done. If the fonts were accurate from typographically spacing point of view, word processor output could be displayed on the screen in its typeset form; this could also be dumped to a printer for rough layouts, although it naturally wouldn't be in a camera-ready condition - Epson dot matrix printers aren't that good!

The fonts provided are Bodoni, Old English, Flash Bold, Commercial Script, Helvetica light, Helvetica light italic,

American typewriter medium, italic, Helvetica medium, Bodoni italic, sans-serif shaded, Microgramma Extended and Old Germany.

MF Basic

First the bad news: MultiFont Basic is an extended version of Microsoft Basic. Now the good news: the extensions are As its name implies, it's designed to take full advantage of the multi-fonts facility and in addition it has comprehensive graphics abilities to make really good use of that superb 640 x 400 high-resolution screen.

But first I've just got to tell you about the editing facility. Anyone who has tried programs with standard write Microsoft Basic must, like me, have been occasionally reduced to tears of rage and frustration at the appalling, horrible, unfriendly, fiddly editing arrangements for correcting all your mistakes. I hate it (and so does everyone else I know who is familiar with it and has seen the screen editing supplied on some machines). Well, Epson obviously hated it, too, because it has been swept aside on the OX-10 with a proper screen editor.

Let me explain this for those of you unfamiliar either with Microsoft's socalled editor or with proper screen editors. The Microsoft editor treats the screen as though it were a piece of paper emerging from a printer. To correct a wrong line, you type EDIT 15230, say, and you get the line number with the cursor next to it printed on the screen. Pressing the space bar moves you along the line, displaying each character one at a time. You thus have to position yourself just before the wrong character (which you can't see, of course) and then use special commands to insert or delete whatever's wrong with the line. There is a command which will display the line and put you at the start of a new copy of it but the whole process is too much hassle - I can never remember the commands for moving back and forth along the line and I always end up retyping the line to the accompaniment of much swearing.

Even the original Commodore PET had a better arrangement than this. You LIST your program — or section of it, or

one line - on the screen, move the cursor to it, along it, back and forth, whatever, until you find your mistake. You can overtype, insert or delete (using 'insert' and 'delete' keys) and as you change what appears on the screen, so the program in RAM is changed. The only restriction found on some machines, including the Epson, is that changes are only accepted if you move to the end of the corrected line and press RETURN. Needless to say, I was immensely pleased to discover that I could edit programs using the Epson's cursor control, insert and delete keys. The last time I asked anyone at Microsoft when they were going to do something about their stupid editor I received some mumbled comments about hardware difficulties and a swift change of subject. Full marks, then, to Epson, for doing something about it.

Having raved about the editor, I must now confess to being able to say little more about MFBasic, as a manual was not supplied with the machine and requests for one didn't produce the goods in time for this Benchtest. It does appear to support standard Microsoft Basic, though and this would make it 'upwards compatible' - a program written in standard Microsoft on one machine should run on the OX-10 but one written on the OX-10 and using the machine's special features obviously wouldn't work on some other computer.

automatically Loading **MFBasic** activates the multi-font card and you can access the fonts directly from MFBasic. It also reconfigures the function keys so

SPELLING TEST

This programme is designed to give a standard oral spelling test. using the sound track of the taperecorder, to dictate either single words or words and sample sentences. The responses are then typed using the keyboard, which will subsequently be displayed on the screen and, if required, can be kept as a permanent record using a printer.

WORD DRILL

This programme is designed to give a multiple choice vocabulary quiz. Words and their definitions are entered into the programme using the keyboard or from a previously prepared tape file. The computer will then display randomly selected definitions with a choice of eight words. The correct word must be chosen before the preset timer reaches zero. This programme could be used for words and definitions, a geographical quiz, chemical formulae, etc.

MATHS DRILL

This programme is designed to help children practise addition, sub traction, multiplication and division.

- Programmed for up to 6 students
- Answers are written as on paper
- Division can be written showing "remainder"
- Ten different skill levels
- "Smiley" face and graphics used as rewards
- Skill levels adjust to ability
- Problems timed
- Correct answers are displayed if error made
- Full report at end of test

ESTIMATE

This programme is designed to help children practice their mental arithmetic. A selection of addition. subtraction, multiplication and division is given.

- Programmed for up to 5 students
- Five skill levels
- Time taken to answer is recorded
- Correct answers are displayed if error made
- Full report at end of test

E FROM DRAGON 32

Back in the early days of the micro business, one company dominated the low-cost dot matrix printer market — Centronics. So widespread were Centronics printers that the parallel interface used by that company became an industry standard, along with its name; the Centronics parallel interface is still called that although another company has long since taken over the lead: Epson.

The Epson MX series of printers rapidly gained a good reputation as solid, very reliable and quiet units which could be left to churn out hard copy for hours on end. They weren't particularly quick but, unlike some printers, they never had to stop to cool down in the middle of a long job and you could at least hold a telephone conversation in a normal voice with one working next to you.

The MX range underwent several refinements, ending up as a very versatile little printer with full bit-mapped graphics capability. By the time it was withdrawn, the MX mechanism and electronics could be found everywhere, not only in Epson's own packaging but in a huge variety of cases with all sorts of names on the label.

The MX range has now been replaced with two new models, the RX-80 and FX-80. This Checkout is of the latter, the RX-80 being a lower cost, traction feed only printer with fewer facilities and working at 100 characters per second compared to the 160cps of the more expensive model. At a recommended retail price of about £430 plut VAT (but it is already being discounted by some dealers), the FX-80 is likely to be a big seller while the RX-80, at around £300 plus VAT, will probably appeal to those with a tight budget.

The FX-80 is somewhat larger than its predecessor, especially in width. A quick look at the back of the machine reveals one reason for this — the power lead and interface connectors have both been moved clear of the paper, a very welcome improvement as both tended to foul the paper's free movement on the older models.

External controls remain the same as on the MX models: a rocker switch for mains power at one side and three square buttons on the top to the right, one to put the printer on or off line, one for form feed and one for line feed. These last two only work with the printer off line and there's a green LED indicator which lights up when the machine is on line. Three other LED indicators are provided, one for power, one to show the printer is ready and a red one to show when the paper has run out. This last event is accompanied by a series of bleeps from the printer, unless it has been sent a special control code by the computer to turn off the paper end detection facility. Like the MX series, the machine has a self-test facility which operates if you turn it on while pressing the line feed button and continues until you turn the machine off.

The FX-80 has both friction and pin

EPSON FX-80

Has Epson produced another winner printer. Peter Rodwell gives his verdict.

Feeding in continuous stationery is much easier than with the MX models. There's now a pin feed mechanism at the end of the roller rather than a separate unit and with the release lever slid forward, paper is slipped behind the roller and the roller then turned; the paper automatically engages on the pins and it's done. Simple though this procedure is, it has been provided at the expense of versatility: the machine can only use paper between 9½ and 10inches wide unless an optional tractor feeder is purchased, in which case it can handle paper from 4in to 9in.

Set-up

Like the MXs, the FX can be configured for various conditions by changing the settings of internal switches. But unlike the MX models, you don't have to take the machine apart to get at them: they are located under a small cover, released by a single screw, and can thus be changed even with the paper still in the printer, a great improvement. The switches give you the following options:

— column length, 80 or 132 columns, normally set to 80. Setting it to the 132 column mode puts the machine in condensed mode automatically;

choice of zero being printed either as '0' or 'O' (it's normally '0');

— paper end detector on or off, normally

 enable or disable the 2 kbyte buffer, normally disabled;

— emphasised or normal printing at power on, normally normal;

— and a choice of nine international character sets: US, French, German, British, Danish, Swedish, Italian, Spanish and Japanese. As these use ASCII symbols such as '[' and ']' for various national characters like the Spanish upside-down question mark, I can envisage some pretty weird C source code listings appearing all over Europe!

A second group of switches gives control over functions such as turning the buzzer off permanently, automatically performing a line feed on receipt of carriage return or not and automatically skipping over the paper perforation when there's less then an inch left on the page.

Character sets

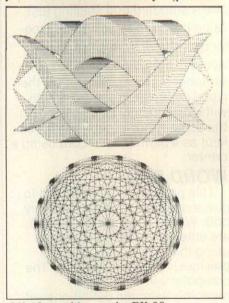

The FX-80 has a tremendous range of built-in character sets, far more than any other printer in this price range which I have come across.

The normal font looks almost exactly like that of the MX range with only a couple of minor alterations as far as I

well as enlarged condensed (68 column) sets, just like the MXs. But the FX also provides an elite face (12 characters per inch instead of the standard 10) and elite enlarged and in addition has a proportionally-spaced font. The standard font is also available in an alternate face, italics, with changeover being made through special control code sequences.

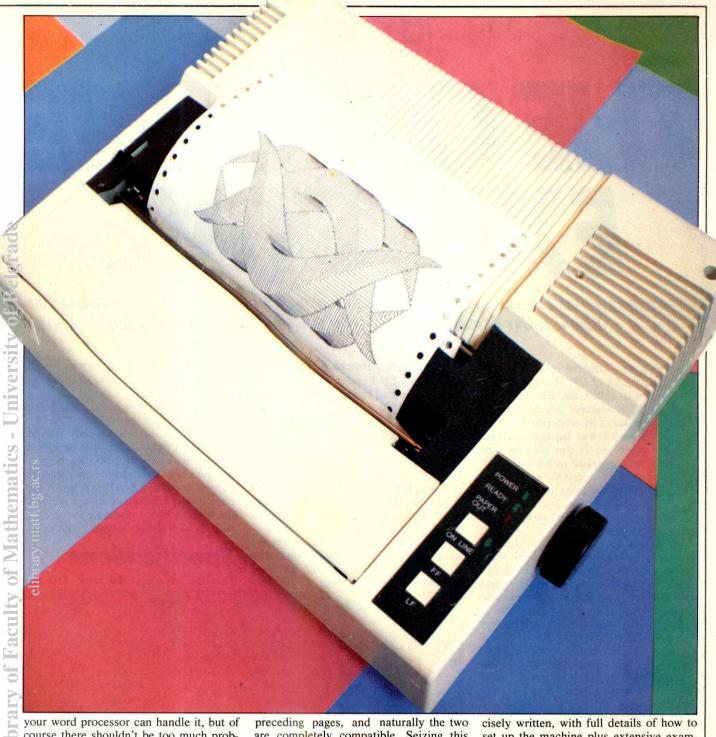

The proportionally-spaced font is very pleasant, especially as electing it automatically places the printer in emphasised mode, and it is quite acceptable for all but the most formal of letters (grovelling to the bank manager, declining a life peerage, etc). As far as I could establish, it actually has only two widths, one for 'thin' letters like 'i' and 'I' and one for everything else.

Generally speaking, it's possible to mix printing modes quite easily, producing, say, proportionally-spaced italics or emphasised large characters. This gives you tremendous versatility (provided

QX-10 graphics on the FX-80

The quick brown fox The quick brown fox The quick brown fox quick brown fox quick brown fox The quick brown fox The quick brown fox The quick brown fox The quick brown The quick brown fox The quick brown fox The quick brown fox The quick brown The quiek brown The quick brown The quick brown for

your word processor can handle it, but of course there shouldn't be too much problem if you're using some other suitably configured software).

Graphics

A hefty section of the printer's thick, spiral bound manual is given over to its graphics capability. Again, a variety of modes are possible: 576, 640, 720 and 1920 horizontal dots, with variable line spacing to obtain just the effect required. Note that one mode gives the same horizontal dot resolution - 640 - as the Epson QX-10, Benchtested in the

preceding pages, and naturally the two are completely compatible. Seizing this fact, I cheated to produce the graphics shown below by dumping from the QX-10's screen to the FX-80.

Of course a major advantage of the dot graphics is that you can define your own character sets and produce all sorts of fancy effects, although the FX-80 has such versatility in its built-in character sets that I'd be hard put to find a use for any more which would justify the effort of designing and programming my own fonts. Still, if you want to do so, the manual gives full instructions. The manual gives full instructions. manual, by the way, is clearly and concisely written, with full details of how to set up the machine plus extensive examples, in standard Microsoft Basic, of how to send the character control codes. There are also complete diagrams of all the character sets and permutations possible on the machine.

Conclusions

The FX-80 has got to be another winner for Epson, even though a cheaper machine is being marketed - it wins on the massive range of facilities, which should be enough for anybody's uses. The only problem you might face is in interfacing it to your software; the range of facilities and the codes required to control them vary so much between manufacturers that it's extremely difficult for standard software packages to cater for all possibilities.

Although the FX-80 is slightly noisier than its predecessors, it is twice as fast and this makes a tremendous difference if you have lots of stuff to print out. As an all-round printer selling at a reasonable price it definitely is worth seriously

THE OSBORNE EXECUTIVE

The Executive — to be launched this month — tackles all the criticisms levelled at its predecessor, the Osborne 1. Guy Kewney judges whether the result has been worth waiting for.

There is a new Osborne microcomputer: cheap, with a lot of CP/M software free, portable, and called the Executive. Its main technical features are designed to satisfy criticism of its predecessor.

The Osborne 1 was the first briefcase portable computer. It was also the first computer to be supplied with a 'full set' of what is today recognised as essential applications software; and it was launched at a price which was so low that it was very nearly the first CP/M micro to sell for under £1000.

As a pioneering machine, it attracted enthusiasts, who were excited by these features — plus other advanced design ideas, such as a screen that was both less (52 visible columns) than most and also more (128 columns, around a 'window').

Virtual Library of Faculty of Mathematics - University of Belgrade

But it was also a collection of very apparent faults, so that it was always possible to deride it as a machine which 'gave you what you paid for'. It had tiny diskettes with only 90 byte capacity each, a very small screen, and it was dreadfully ugly.

'If only the Osborne had bigger disks,' people said, or 'If only it had a slightly bigger screen,' or again 'I can't stand watching the screen jump around with that scrolling window: why can't it have an ordinary 80 column display?'

The new Osborne 2, called the Executive 1, and the soon-expected Executive 2 are both remarkable for having done very little — on the surface — other than answer these comments. But closer examination shows that there has been a considerable re-think especially in the software, mainly with the arrival of the far more sophisticated CP/M Plus operating system.

There is also a lot of new 'free' software, including Pascal, a program generator, and many advanced programmers' utilities for machine code production.

Presented with two Osbornes, one the model 1 and the other an Executive, the only distinguishing characteristic is the slight camel's hump under the carrying handle. The hump is to accommodate a cooling fan, which betrays the fact that despite the similarity there is more to the

new machine.

from the layout. Instead of one disk on either side of the central display screen, they are now half-height drives, one above the other, on the left.

Then you notice that the screen is a bit bigger than before. On the right is an air intake grille. There is a 'proper' Centronics port — not the funny edge connector that used to baffle so many customers who bought printers and couldn't connect them when they got home. There are two serial ports, not one, and a 'modem' plug.

Only when you look for the power 'on' switch, and find it in front of you (rather than tucked away behind with the fuse), and press it, do you realise that the new

screen is not just a bit bigger, but has changed colour. It is 'restful' orange —and it has 80 columns.

'Insert disk in drive A and press Return' is the message on the screen.

It is fair to say that anybody who has ever used CP/M before will be able to take on the machine from this point — without any help from the manuals, because the 'HELP.COM' program supplied on the first system disk explains all the features of the machine, including all the CP/M programs supplied with it.

The first character determines whether you are entering a formula or a text string (label). A quote mark (t) starts a text string. An apostrophe (t) starts a reseating text string any other character starts a formula.

While entering data, the armow keys (which normally scroll around the worksheet) become "editing" keys:

Left armow (or CTRL/S) --> Backspace one character.

Right armow (or CTRL/S) --> Hove right one character.

Bo armow (or CTRL/S) --> Delete one character.

Bown armow (or CTRL/S) --> Delete one character.
```

The seven inch screen displays 80 characters per line

cessor as the Osborne 1, running at a perfectly ordinary 4 Mhz — which means that its performance on running program instructions in Basic is almost identical to its predecessor.

However, there are differences between one CP/M system and the next — depending on the way the processor board is constructed—and the Osborne 1 was relatively quick at running Microsoft Basic.

One factor which can affect benchmark timings is the number of 'wait states' that the processor gets caugh, up in, when signals are expected from its subordinate chips, and take longer than the Z80 would ideally like.

The operating system for the preproduction model supplied is CP/M Plus, which differs enormously from CP/M in several ways: one of these is the way it handles disks, and another is the way it extends memory.

The Executive has 124 kbytes of memory. Theoretically, under CP/M Plus, this could be extended in 'banks' of 48 kbytes, all of which share the same memory contents for the top 16 kbytes. On the Executive this theoretical expandability has been ignored, on the grounds (I think, spurious) that there simply isn't room in the case or power in the power supply for another memory board.

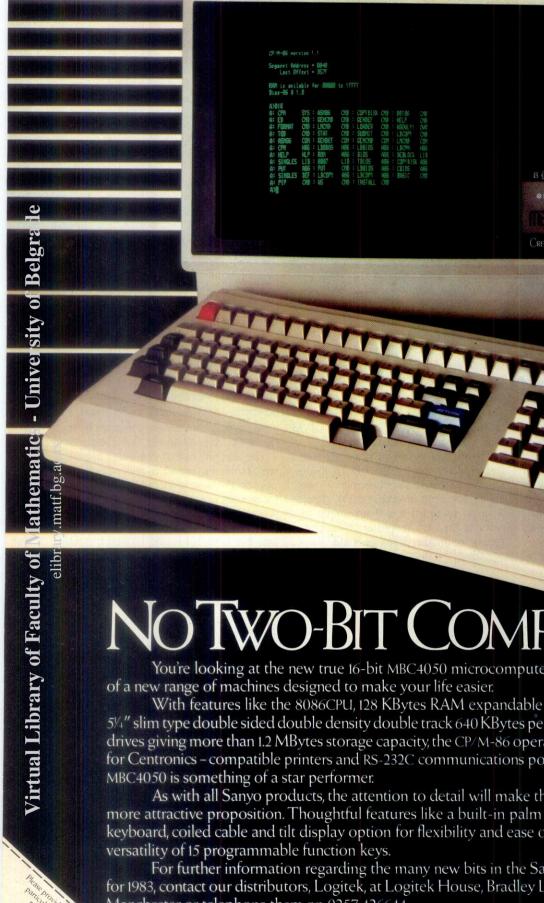

As to the power supply, the company may have a point. This system, like most modern desk-top micros, needs a fan to keep it cool. The vent at the front is obvious. At the back, there is a closable hatch over the fan — with it closed, the fan will have no effect except to generate a certain amount of extra heat. On the top, there is a larger ventilation hatch, identical to that on the newer, cased version of the Osborne 1, where simple convection was more than enough to cool it down.

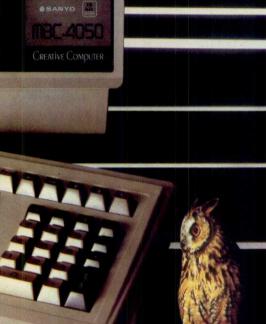

There was a plan (still not rejected) to put a switch into the system, so that the fan only worked when the computer got hot. On the test machine, this heat sensing had not been included, so the noise of the fan simply had to be tolerated — and the noise, I'm afraid, did betray the fact that the power supply finds the disks a bit of a strain, because the note of the fan hum drops quite noticeably when they come on. It must also be pointed out that the power is much beefier than the Osborne I could put out, and this machine can operate both disks together — the old one would have blown a fuse.

Total memory in the Executive is 124 kbytes (see memory map diagram) with 60 kbytes of this available as the 'transient program area' — transient programs being things like SuperCalc and WordStar.

The machine can be connected to printers, terminals, modems and other peripherals through two RS232 ports, or a Centronics port which can be reprogrammed as a universal HP interface bus (IEEE 488 standard). Invisible to the user but available to the system designer

NOTWO-BIT COMPU

You're looking at the new true 16-bit MBC4050 microcomputer from Sanyo, Just one

With features like the 8086CPU, 128 KBytes RAM expandable up to 384 KBytes, twin 5¼" slim type double sided double density double track 640 KBytes per drive mini floppy disk drives giving more than 1.2 MBytes storage capacity, the CP/M-86 operating system, interfaces for Centronics - compatible printers and RS-232C communications port, you can see that the

As with all Sanyo products, the attention to detail will make the MBC4050 an even more attractive proposition. Thoughtful features like a built-in palm rest on the detachable keyboard, coiled cable and tilt display option for flexibility and ease of operation, and the

For further information regarding the many new bits in the Sanyo Computers range for 1983, contact our distributors, Logitek, at Logitek House, Bradley Lane, Standish, Greater Manchester or telephone them on 0257 426644.

Alternatively, clip the coupon below and return it to Sanyo. We'll send you information on any of our business machines, all designed to mind your business more efficiently.

THE OSBORNE EXECUTIVE

or the clever add-on merchant, there is a direct memory access (DMA) port.

The serial ports are considerably upgraded on the originals, being programmable to run at any baud rate from 50 to 9600. The Centronics port on the old machine was just an edge connector, which meant considerable trouble in tracing a suitable cable. On this one it is still not absolutely standard as a Centronics plug because it lacks the little wire 'hooks' that lock the cable in place. However, any Centronics cable will plug firmly enough into it. And it is, apparently, a 'standard IEEE socket'.

The Direct Memory Access port is of no interest to anybody who is not planning to upgrade the Executive into a 16-bit processor with the add-on 8088 card. No more need be said of it at this stage, since it isn't available.

The diskettes, apart from being half-height, offer no surprises to Osborne 1 users, nor to anbody else. The slightly disappointing surprise is that they are still only single-sided, double density, with a maximum capacity of 200 kbytes.

Against that, they are pretty clever, being able (used with care) to get data off the Digital Equipment Robin (VT180) CP/M kit, the Xerox five-inch disk format, the Cromemco minidisk, and the BM (CP/M-86 only) double density, as well as from earlier Osborne diskettes. That is all without loading any special program.

With the use of specially bought programs, these drives can be used not only to read, but to format, and to write, for some 20 other five-inch formats, since the operating monitor program does not force user programs to go through CP/M disk handling routines, but offers the alternative of direct access.

Software

Standard software supplied with the machine is:

UCSD P-system (Pascal interpretative run-time operating software) and CP/M Plus as operating systems; CP/M utilities, and Osborne utilities for programming the machine or for changing its operating characteristics; Executive Data Base Manager; Supercalc 1.12; WordStar 3.4 (with Mail-Merge) and Microsoft 5.3 disk Basic (interpretative) with CBasic 2.37 (compiled) as programming languages.

Total shop value of that lot would be around £1500.

The utilities are worth a more detailed mention, because all too many CP/M systems skimp on these. This system comes with almost as full a set as one could wish.

In particular, the old insistence on supplying only standard CP/M programs that would work on any CP/M system has been dropped; and the assembler program Z80, whereas ASM.COM could produce only 8080 code.

The CP/M utilities are nice; but it is the Osborne utilities that make the machine. They get a special section to themselves, below, in the 'machine under test' section.

As on the Osborne 1, all the numeric keys are programmable to send a string of characters to the console, or to any other CP/M 'logical' device. There are a total of 288 memory locations in memory, set aside to store these strings, more than twice the limit on the Osborne 1. In addition, the cursor arrow keys can be directly programmed — on the original system, there was merely a choice of 'WordStar' or 'CP/M' standard control characters.

The screen is the first piece of hardware to show a definite reduction, rather than increase, over the Osborne 1.

Adam Osborne has said that the seveninch screen was the right size improvement — that most people felt it was 'a lot bigger' than the old five-inch screen, whereas a nine-inch screen didn't offer much over the seven-inch.

But where the old five-inch screen displayed only 52 characters per line (and this new seven-inch screen displays 80), it actually was capable of showing you 128 characters, with a little clever scrolling.

That has gone (see above), and its loss will disappoint Osborne fans.

The Executive under test

Testing the machine was a challenge which I happily dodged. I am prepared to make slight apologies for not trying out the database or the program generator, or the terminal emulation facilities, each of which warrants a full software text on its own. WordStar version 3.4 is very well known; Supercalc is a spreadsheet which needs introduction only to those who don't know what spreadsheets are; and the assembly level utilities are of interest only to the user who has had the machine for some time, or for the systems software professional (who knows them all backwards anyway).

What I did test was the new Setup and character generation utilities, SETUP.-COM and CHARGEN.COM.

Chargen is a character generator. It shows you a grid of pixels, and you can load existing characters in for alteration, or develop your own from scratch. Having gone right through the dot matrix for each letter, you can end up with a character set on disk, automatically loadable, which will give serifs for each letter. Or you can write in Greek. All you need is disk space to store the characters.

Setup does almost anything. It will program one user port to use the ET/ACK protocol, at 9600 baud; the next to do XON/XOFF, at 50 baud; or both; or neither. It can set the cursor to be visible or invisible, blinking or steady, block or underline, or any combination (though obviously not invisible blinking anything) and can change screen attributes to flash,

60 Hz mains flicker. That is one of the more irritating things that can happen on US built machines, where the frequency of the screen refresh can often clash with the UK mains frequency, producing wobble, flicker and other eye-irritating nasties. On the Executive, Setup can be told what the mains frequency is, and will adjust the screen frequency to avoid these problems.

But one thing Setup cannot do is edit the programmable function keys. Nor, infuriatingly, can it be programmed to send two 'ESCape' characters (Hex 1B) after each other.

The most obvious use of Setup for programming function keys lies in telecommunications, where logging on to remote computers can be a matter of typing up to 30 characters in batches of 10 (or so)—any one of which, if mistyped, can force you to start again. Press the 'control' key and one of your pre-programmed function keys, and the whole string will go out perfectly.

I find this invaluable on WordStar, where quite complex sequence of multi-key commands can be transmitted with one finger. The trouble is that when you come to alter a sequence, you have to type in the new sequence from the start — you cannot just change the offending character. It may seem a small quibble, but when you have WordStar loaded, a file ready to save and find that you've accidentally left out the letter S in a complex save and print sequence, tempers can wear thin.

Since there is no editor, when typing in programmable sequences there has to be some way of telling Setup that you have finished. Osborne chose two ESCape characters as the indication. So you cannot program your telecom system to send two ESCape characters sequentially — which is something you have to do, using Osborne's own approved Amcall program, in order to transmit an ESCape to the remote computer. A silly oversight, and definite proof that nobody at Osborne uses Comshare electronic mail.

One other thing that Setup cannot do is change the screen width.

It is perfectly possible, with the Osborne 1, to set up the machine (using the SETUP.COM program) so that no user is ever aware that he has 128 characters, or that there is any scrolling ability. There were reasons why this wasn't done—principally, the 80-column WordStarmenu displays, which would have been illegible.

But none of these apply to the Executive.

The designers have thrown that nice wide screen away. With automatic 'scrolling' off, the machine set to have a logical screen width of 80 columns and standard software running, no one would ever be troubled by screen flicker, or horizontal scrolling jump. The only possible drawback would be that since the new screen actually needs 12-bit memory, it would use up quite a few memory chips to do this—but with only 4 kbytes devoted to video memory, the extra involved could hardly be seen as prohibitive.

Scientist's dilemma

I am looking for a cheaper alternative to the Hewlett Packard HP85 for use as a scientist's personal computer. The Newbrain is attractive for its graphics, and low price, while the BBC Model B is attractive for its faster Basic, and expansion capability.

The PCW review of the Newbrain suggests that a program will be executed faster on subsequent runs than on the first, as it only needs to be compiled the first time. If this is so, how much faster?

How complicated would it be to have a sub-routine to dump the contents of the screen to a printer with either of these machines? How difficult would it be

to use one of these micros

plus a video monitor as a terminal to a mainframe? JR Senna, London
The Newbrain 'compiler' compiles each line into a 'tokenised' form as it is entered. This tokenised version of the program is then run in an interpretative manner each time the program is run. There is thus no dramatic speed-up in execution, such as that associated with true compilers.

The ability to allocate 'devices' to 'data streams' on the Newbrain should make it relatively easy to copy the screen to a printer. On the BBC micro, the VDU command allows the screen and printer to display the same text when required, and routines have been published by Beebug and others to dump the high-res graphics screen to a matrix printer.

There should be no problems using either of these machines as terminals to a mainframe. The wide range of stream concept should take care of this. Equally, the RS423 port and the operating system commands of the BBC make this relatively easy. *P L McIlmoyle*

Time to switch off?

I want to use my micro as a timeswitch to turn mains powered equipment on and off. Can you give me details on how to switch mains circuits from a computer? P Halsey, Birmingham

There are several vital safety aspects to consider, and I advise you not to construct any mains unit unless your wiring skill, attention to detail, and electrical knowledge are of a high standard.

First, all low-voltage circuits must be properly isolated from the mains. This is to protect the users and, less important, the computer. The simplest way to accomplish this is to use a Solid State Relay to switch the power.

Second, the micro and all other equipment must be safe to leave switched on unattended.

Third, the equipment should be operationally safe. It should not present a hazard to people who do not know it is automatically controlled. Heaters and moving machinery might be a problem. What happens if your control program crashes and leaves strange combinations of units on?

These two products will solve the mains isolation problem:-

Gem Systems Ltd, 2 Crawford Road, Hatfield, Herts, tel 66148, supplies a Power Switch Box ready built, which will switch 3A per channel. The computer interface is Centronics or VIC 20. Four channels cost £69.95, and the

TK Electronics, 11 Boston Road, London W7, tel 01-579 9794, offers the XK112 Mains Wiring Transmitter/ Receiver kit. This controls appliances remotely by signals transmitted over the mains wiring. The interface is five lines driving opto-isolators. The two channel kit costs £42, and independent 2KW channels are allowed. Len Warner

Bigger and better

Please can you tell me how to obtain enlarged characters, condensed characters, and all the other styles that the Epson MX80 allows. I am using a BBC micro and have tried sending control codes to no avail.

Joseph Thompson, Edgeware Control codes sent to the printer are removed by the operating system on the BBC micro. You will be aware that to send output to the printer you must use VDU 2, and to stop output going to the printer you send VDU 3. For example:-10 PRINT"APPLE" 20 VDU 2 30 PRINT "ORANGE" 40 VDU 3 will print APPLE and ORANGE on the screen, but only ORANGE on the printer. To send any single character (even control codes) you use VDU 1. The '1' must be repeated before each character sent. For example:-10 UDU 2 20 PRINT"APPLE" 30 VDU 1,14 :REM enlarged 40 PRINT"ORANGE" 50 VDU 1,20 :REM enlarged

60 VDU 1,271,69 :REM

will print in normal, enlarged

and emphasised mode in turn,

70 PRINT"PEAR"

emphasised

80 VDU 3

output off. Line 60 is the way to send 'escape'+'E'. One VDU command can contain the VDU 2 function, several VDU 1 codes, and the VDU 3 function, if required. Sheridan Williams, Beebug

Spectrum machinations

I have recently purchased a Spectrum and have been experiencing difficulties in moving a number of things on the screen at the same time, which obviously needs machine code to make the speed acceptable. The Spectrum books I have seen shy away from the problem or give brief and poorly explained examples. I am looking for a book with a series of Basic examples of all the Spectrum functions with equivalent machine code routines to do the same job. What can you recommend?

B T Izzard, Chelmsford I don't think you will find the book you ask for, because the time wasted in Basic is largely in scanning the program and data areas to find the right program line and variables. The function finally executed is in machine code and fairly efficient. A machine code program scores by using fixed areas of memory for program and data and by making direct calls to ROM routines. Sometimes machine code can eliminate lots of unproductive Basic internal housekeeping operations, eg, in a routine which is moving data with a loop containing PEEKs and POKEs.

The solution is to learn machine code and the architecture of your micro, so that you can choose the most direct way to carry out a task. I think you will find 40 Best Machine Code Routines for

COMPUTER ANSWERS

because it teaches machine code with a set of routines which should be useful building blocks for later programs and concentrates on screen handling problems.

It is available from MoI. 1 Francis Avenue, St Albans, Herts, tel (0727) 52801 for £6.90 post paid. Len Warner

Engineering calculator

I would like to purchase either a small computer or a programmable calculator capable of dealing with engineering problems such as pipe-sizing, heating and cooling loads, etc. I have no knowledge of computers, and hence would be looking for a machine easily mastered by the layman. What would you advise?

P Bagnall, Riyadh

Assuming that you just want the right answer fast, and are not concerned either with having a detailed printout, or with writing your own programs, then I personally think there is a lot to be said for a dedicated electronic calculator for your application. This would seem to be especially so in your case, as there would be no moving parts to get sand into them, and no need for a mains power supply, which might be subject to voltage variations,

The Hewlett Packard, Texas Instrument, and Casio ranges, should be able to offer what you need. The HP calculators tend to provide a range of programs by the use of magnetic cards which need to be fed into the machine. There could be advantages for you in the TI range, which use interchangeable plug-in ROM packs, providing TI have the programs you need in ROM. P L McIlmoyle

Track record

Over the last few months I've been trying to work out how a trackball works. I've talked to my A level physics teachers and they haven't any ideas on the subject. The www. I can think of is hy

John Benfield, Hemel Hempstead

I confess, I have been intrigued by this too, and I don't know. However, let me suggest two feasible methods, and perhaps someone will write in and tell me if I am near the mark.

A trackball is a position controller similar to a joystick, except that you can rotate the ball continuously through as many degrees as you like by rubbing with the hand. So the problem is to resolve and measure the X and Y motions without being able to put a shaft through the ball. One way would be to have two small disks with their edges on the ball and mutually at right angles, so that one rotates for X motion and slips for Y, and vice-versa. The movement could be read by a shaft encoder, giving very low friction and direct digital output.

Another way would be to have a metal ball and five small solenoids with their poles forming the pattern of a cross at the ball's surface. The central pole would be energised with an AC bias, and the four surrounding poles would pick up equal signals with the ball still. If the ball moves, it will drag the eddy current pattern round and upset the signal balance. A differential amplifier, rectifier and a voltage to frequency converter for each axis would give a pulse signal proportional to movement. Len Warner

Filing task

We have a collection of some 3600 photographic transparencies, and are looking for a micro-computer system to index and crossreference these, perhaps by a keyword system. We would want to be able to find which slides showed which subject or combination of subjects. as well as a 40-character description of each subject. Is this possible on any of the cheaper (BBC 'B' or less) micros?

G Jenkins, West Lothian The problem of attempting to use a machine such as the BBC Model B, or a similarly priced unit, for an application

described, would take up some 150 kbytes just for the 40character descriptions. It is not really satisfactory to handle amounts of data such as this with an ordinary cassette recorder. Normally, I would strongly recommend disks for such work. Indeed, all the database systems with which I am familiar for such applications are disk-based, and typically cost £200-£600 for the software alone!

An alternative would be to use the system with Philips mini-cassettes for storage of data, as these run faster than ordinary audio-cassette systems. The Hobbit has been available for the Nascom for a long while, and the new BBC version has been receiving good reviews. Another possibility is the Sinclair Microdrive, when it becomes readily available.

It may be some time before many database packages are marketed for these tape

systems.

If you do take the plunge with disks (with a minimum cost of £1000 to £1500 for hardware) then I would be thinking in terms of DMS, or possibly DataStar plus Super-Sort, for your application. P L McIlmovle

Hold your tongue!

The Namal Supertalker produces speech from a 550 word dictionary in its internal ROM, and I have been able to write programs which use the ROM but I am unable to use the extended dictionary facility to add to the unit's vocabulary. According to the instruction booklet it is necessary to POKE the new words into addresses 12288 onwards. I have found it impossible to do this because these addresses are 'unPOKEable' on the Spectrum. I am obviously doing something silly and I would be very pleased if you could put me

W Cooksev, Cambridge The ZX81 and Spectrum versions of the Supertalker have RAM space from 12288 for extending the dictionary. In the ZX81, this lies in the reflection of the 8k Sinclair ROM, so the ZX81 Supertalker switches this out using ROMCS. Hence ZX81 users can use Basic or machine code to POKE new words.

However, in the Spectrum this area is occupied by the 16k Sinclair ROM, so it is not POKEable from Basic. The Spectrum Supertalker has a memory bank switch to alternate between the Sinclair ROM and the dictionary RAM. You must use a machine code routine like the one in the booklet in order to swap these sections of memory in and out properly. Interrupts are temporarily disabled, then banks switched by an OUT instruction. Unfortunately the mnemonic code version of the routine and the denary machine code disagree about the port address, but since you have been able to use the ROM vocabulary I assume it is 127 = 7Fh and not 128 = 80h. A quick experiment will tell you which is right. Len Warner

MICRO CHESS

PHANTOM MOVES

Tony Harrington provides an insight into the seemingly magical effect of a chess computer, known as the 'Phantom', which mysteriously moves its own pieces.

For your true chess enthusiast, once the game has well begun the best that can be said about the materials, with which the game is played, is that they should cause as little of a distraction as possible. A chess board that draws attention to itself by its fluorescent colouring or any other oddity is simply an irritant. Similarly, an ornamental chess set modelled on the Chinese Mandarins of the tenth century might be a wonder in a showcase, but a pain in the neck to play with.

Much the same is true of chess computers. Once the game is under way, it really does not matter how the computer signals its move, so long as it does so clearly and concisely. Like most chess players, I've got used to the quiet flashing of a couple of LED lights, accompanied by a demure 'beep' whenever the machine has found its move.

So when I was given the opportunity to look at the Milton Bradley machine, which rejoices in the mysterious name 'The Phantom', I had my doubts. The marvellous feature of this machine, I was told, is that it moves the piece itself. It has a reasonable program, but that is almost beside the point — the point was that progress had been made in the direction of the magical.

The usefulness of a machine that could literally make its own moves was not clear to me. Why should it be a significant advance on existing machines which simply sit there, lighting up their LEDs in a friendly sort of way and waiting patiently for you to do the decent thing by them?

I sat down before the Phantom with some scepticism. Following the great — and now almost forgotten Bobby Fisher's dictum — I opened with the king's pawn. What followed is hard to describe. A motor started into life, rather audibly, and Black's king's pawn slid firmly out to e5 and stopped. So did the motor, and I was left in a deepening silence to think about my next move.

I brought the king's knight out to f3. The motor rasped into action and Black's pawn on f7 slid a fraction of an inch to one side. For a moment I thought the machine had slipped a gear, or sprung a solenoid or something. Then its knight moved majestically through the gap created between the pawns on f7 and g7 to take up its station on f6. 'What about the touch move rule?' I said to my absent opponent. But then, no-one had touched a piece, so I suppose it didn't apply. A pity, I hate playing against the Petroff.

More surprising things were to come a

few moves later when I took Black's pawn on d5 with my e pawn. There were several possibilities for Black, and I was brooding over a few of them when my e pawn, now on d5, suddenly sidled off the board and stood out of play. I was left staring at the blank square and wondering what it was going to recapture with. The pause could only have been a half second or so, but it produced a distinctly odd feeling.

The game itself was not particularly memorable, but it was interesting in its own right. As it developed it began to seem more like a game of chess than the circus performance it had seemed at the beginning. As a marketing gimmick, I think that Milton Bradley has hit on something rather special. My only hope is that the company doesn't put a voice chip in the blasted thing, or you may as well call the neighbour over and play a human being.

Now for the origins of the machine. Milton Bradley rang up Intelligent Software in June 1981 while David Levy and his colleagues were still hard at work on programs for SciSys. According to Levy, whoever spoke to him simply said that he wanted some advice on chess computers. They phoned from the States and asked Levy to go and see them at their East Longmeadow, Massachusetts offices.

'When I arrived they showed me into a room and, after asking me to sign the traditional non-disclosure agreement, they put a machine on the table, switched it on, and a pawn moved — as if by magic — from e2 to e4 — without any human intervention or any visible, physical device for making it move. I was fascinated,' Levy said

This was the idea they wanted to develop: that is, they wanted the mechanism that had just moved the pawn developed to the point where it would be reliable enough to be used in a consumer product. And they wanted a chess program that would work with this mechanism.'

Levy phoned the technical director of Intelligent Software from Milton Bradley's offices and told his colleague about this new machine. After a brief huddle, they decided that this was very much the sort of project they wanted to get involved in. In Levy's words: 'It was the most exciting chess product that we had been faced with and we could not resist the challenge.'

been involved with had been straightforward software programming. This was the first time that they had to get involved with electro-mechanical technology.

Despite this, they undertook to write the chess program and the software to control the electro-magnetic system which moved the pieces. Levy reckons that when he was first shown the machine it worked to the point where it was possible to demonstrate the idea, but there was still quite a way to go before it could be turned into a reliable product which would stand up to the rigours of life in the average home.

So how does the machine move its pieces? The idea is basically simple. There is a solenoid (an electro-magnet) underneath the playing surface. This is connected to a mechanism which moves on two axes, consisting of two metal bars. The one can move down the length of the board, while the other moves down the width of the board.

The solenoid is fixed onto the one axis and is constrained to move by the other axis so that it is always at the centre of the cross-hairs formed by the intersection of the two axes. The bars are controlled by two belts (with teeth), which go round two wheels (also with teeth). A photosensitive device counts how many teeth on each of the wheels move past a certain point. So by counting how many fractions of a turn each wheel has made, the program is able to tell exactly where the solenoid is located under the chess board.

Each piece has a permanent magnet in its base, and when the Phantom wants to move, it first moves the solenoid to the exact position of the piece on the board (all the pieces are of course tracked by the program). It switches on, detects that there is indeed a piece on that square, and then moves to the target square — 'dragging' the chess piece with it.

In the case of captures, it first moves the captured piece from its square to a place at the side of the board, off the playing surface, set aside for it. The surface of the board is a touch sensitive surface, much like that of the Sensory Nine. When the player captures one of the computer's pieces, that piece has to be placed at the side of the board as well, and there is a symbol for every piece set out in two lines on the right and left hand sides of the chess board.

One of the quirks that fascinated me was the fussiness of the machine. Each time I captured one of its pieces and put it down on its square, there was the audible sound of its motor starting up as the solenoid rushed over to check that I had placed the piece correctly on the square appointed for it. According to Levy, if I had put the knight down on a square reserved for a queen, the machine would have immediately moved it — by the shortest possible route (no inefficiency here, please) — to the right square.

As with the Sensory Nine, when the player makes a move, it is necessary to press down lightly on the square of the piece that you are moving and on the square that you are moving to. Levy reckons that the program has an approximate rating of 1550. This is considerably weaker than that of La Regence,

Intelligent Software's own machine, released last December (which has an estimated rating of 1750).

The explanation for this is that La Regence was designed after the Phantom, and with a more leisurely research and development period. Levy's brief was to produce a program stronger than the Sargon 2 running on the Apple computer. The processor involved was the 6502A processor with 2k of RAM and 16k of ROM.

'The rating of 1550', he said, 'comes from 40 games played against the Sensory Nine and the Sargon 2.5, both of which were chosen as adversaries because they have already been rated by the United States Chess Foundation. Thirty games against rated players or rated machines are enough to get a statistically reliable result,' Levy said. 'We played 40 in order to gain even greater confidence.'

'We had never done anything using electro-mechanical devices before. When we first discussed the machine in the company's offices, I was asked how long I thought the job would take. More specifically, I was asked if we could do the work within five months. When I phoned our technical director I didn't tell him the time period Milton Bradley was considering. I just asked him how long he thought it would take. He said: 'five months...'

My guess is that with Intelligent Software already marketing a machine with a stronger program than the Milton Bradley machine, it won't be too long before the Phantom gets a program worthy of its mechanical dexterity.

Games section

White: Fidelity Sensory 9 (level 3); Black: Phantom (level 10); Pirc Defence: Notes by David Levy.

1	.e2-e4	d7-d6
2	d2-d4	Ng8-f6
3	Nb1-c3	g7-g6
4	f2-f4	Nb8-c6

(Unusual and rather pointless. The pin on Black's knight is of no consequence and the bishop would be better placed on almost any other square.)

5 ... a7-a6 6 Bb5xc6+ b7xc6

(Black has an isolated pawn (a6) and doubled pawns (c7 and c6) but despite having made these concessions in its pawn structure, the Phantom actually has the better long-term prospects. This is partly because White has ceded bishop for knight; partly because of the attacking prospects along the b-file; and partly because White's impressive looking pawn centre might eventually prove vulnerable to pressure.)

7 Ng1-f3 Bf8-g7 8 0-0 0-0 9 Bc1-d2

(A poor square for the bishop, but 9 Bc1-e3 accomplishes nothing after 9...Nf6-g4. Perhaps White should have tried 9 h2-h3 and 10 Bc1-e3.)

9 ... Ra8-b8
10 Ra1-b1 Bc8-e6
11 Od1-e2

(Otherwise ... Be6-c4 might be embarrassing, and now White threatens 12 Oe2xa6.)

11		Rb8-b6
12	e4-e5	Nf6-g4
13	h2-h3	Ng4-h6
14	Nf3-g5	Be6-f5
15	Bd2-e3?	

(Too slow. I would have tried 15 g2-g4, when 15...Bf5xc2 16 Rb1-c1 Rb6xb2 17 Bd2-e3 wins a piece (17...Bc2-d3 is best met by 18 Qe2xb2 Bd3xf1 19 Rc1xf1, rather than 18 Qe2xd3 d6xe5 19 f4xe5 Bg7xe5!).

Since Black cannot capture on c2 after 15 g2-g4, play might continue 15...Bf5-d7 16 Qe2-f2, with an eventual Qf2-h4 and f4-f5, attacking Black's king.

The move played in the game hands the initiative to Black.)

15		Qd8-b8
16	g2-g4	Bf5-d7
17	e5xd6?	

(A serious positional error. White weakens itself on the a1-h8 diagonal. Better would have been 17 Nc3-d1, followed by Qe2-f2 and Qf2-h4.)

(More dynamic than the obvious looking 17...c7xd6. Black now has the possibility of play along the e-file.)

Nc3-a4

(Putting the knight offside. White's only chances lie on the K-side, so again 18 Nc3-d1 was called for.)

18		Rb6-b5
19	c2-c4	RB5-a5
20	Na4-c3	Rf8-e8
21	b2 b4	

(Further weakening White's position.)

	(I di dici	Weakening	AA HILCO D	position.,
1	21			Ra5-a3
1	22	Qe2-b2?		
	(22 Qe2	-d2 was ess	ential.)	

(A simple combination which wins material.)

23 Qb2xa3 Bg7xd4
(The point. As a result of the numerous threats created by the discovered check (if Black moves the rook from e3), White has

no time to defend the c3 knight.)

24 Kg1-h1 Re3xc3

25 Qa3xa6 Bd7-c8!

(Winning another pawn, since 26 Qa6xc6 loses the queen to 26...Bc8-b7.)

26 Qa6-a4 Rc3xc4
(Black has a significant material advantage (two bishops and a pawn for a rook), and its king is much safer than White's, so the result of the game is hardly in doubt.)

27 Rf1-e1 Bc8-d7 28 Re1-e7 Qb8-d8 29 Re7-e4

(If 29 Rb1-e1 Bd4-c3, threatening ...Bc3xe1, ...Rd4xb4 and ...Rd4xf4.)

29 ... f7-f5 30 Qa4-a6 d6-d5 31 Ng5-e6 Bd7xe6 32 Re4xe6 f5xg4 33 Rb1-e1

(Threatening to win Black's queen by 34 Re6-e8+.)

,	
	Kg8-f7
f4-f5	Nh6-f5
h3xg4	Qd8-h4+
Kh1-g2	Qh4-f2+
Kg2-h3	Qf2-g3 mate
	f4-f5 h3xg4 Kh1-g2

MICRONET 800 AN ELECTRONIC MAGAZINE?

Maggie Burton explores the derivation and growth of the viewdata service, Micronet 800.

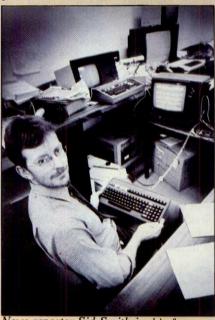

Micronet 800 is the new approach to Prestel. It's a subscribers' viewdata service which allows micro users to link their computers into the large Prestel network through its own database of micro tips and information. Prestel was the first ever public teledata service. Run by Buzby's 'Politburo', it was quickly found to be a rather expensive prospect — what with subscription fees, special television sets, page charges and phone bills. From the start, the user base

was small, and it still is. Promotion has always been virtually nil, and people often do not realise how much valuable information is contained within its pages.

Well-intentioned though it may be, Prestel has previously been little more than

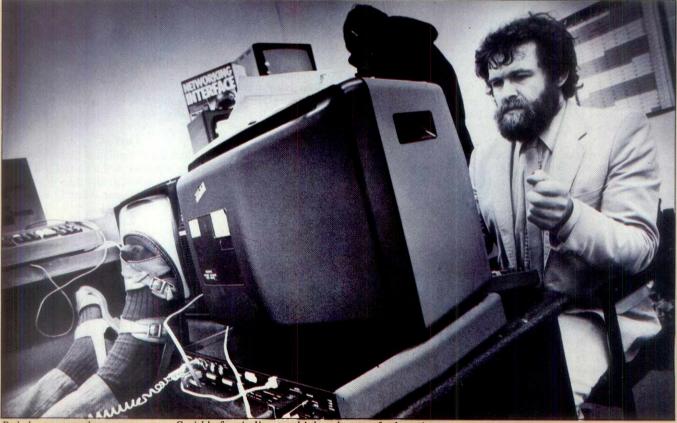

Micronet software display

Reporter Dave Babsky chases a runaway mouse

Babsky contemplates news copy: Smith's feet indicate a higher degree of relaxation.

otography by Tony Sle

The Spectrum with modem attached and the Micronet acoustic coupler.

an executive toy; a plaything of company directors. Now perhaps that is changing, thanks to Micronet 800 which combines the speed and efficiency of the teledata system with the hard-won views of the printed media.

Origins

Micronet began as EMAP's (East Midlands Allied Press) venture into information provision for Prestel. Information providers have to make their services pay in some way, either to offset Prestel charges or, if they're selling something through it, to make a profit. EMAP's venture was a loss-making one. Richard Hease, the owner of ECC (publisher of Educational Computing), had become involved with EMAP following the sale of some of ECC's computer publications to EMAP. He was working as a consultant in the area of computer publishing when EMAP asked him to look into the Prestel venture and, literally, either to make it work or close it down.

Hease became interested in the idea of telesoftware. Coincidentally, a competition was being run in *Sinclair User* to design a cheap, reliable Prestel adaptor. 'I thought the only way Prestel was going to work was to make it possible to link micros into it and develop a database micro users would want,' he says. Realising that his idea would need sound financial backing, Hease decided to seek it out.

The idea of a computer users' database — combining free telesoftware, news and on-line shopping facilities — was presented to Prestel. Prestel liked the idea and invested in it. The Department of Industry also moved in with financial backing.

'Both Prestel and the Dol,' says Hease, 'moved faster than I've ever seen a government or bureaucratic organisation

move. Within weeks we had everything sorted out.'

Provisions

Micronet was first presented to the public last summer. Advertisements invited enquiries and, on the basis of the replies, the first users accessed the database in March this year.

The variety of information and services is already considerable and, by the end of the year, should be even greater. At present, Micronet has a large news section, updated daily by intrepid reporters (the end of the weekly is nigh — Ed), free programs which can be downloaded straight into a micro, onscreen games which are resident in Micronet, product news and facts from companies like Sinclair, a teach-yourself Basic course, Computermart: second-hand micro advertising (and jobs too), a mailbox, problem page (Agony aunt's 'Elpful Area), quizzes, reference lists . . .

These are all great if you happen to have a micro or an interest in micros. Micronet offers educational value and, because the screens are bright and often very funny (the Computer Club title frame depicts a row of micros leaning on each other, all wearing boots), kids should like it and learn from it. Some of the onscreen games (that is, those which you don't have to load first) offer prizes for the winners. A version of adventure offers a prize draw between users who solve it.

Following Micronet is a little bit like playing an adventure game, but easier. It's a big, cheerful, Alice-in-Wonderland database and, if you haven't seen it before, it can be both confusing and fascinating. 'Something new is always just around the corner,' explains one satisfied user.

Micronet, besides being a large computer information service (it has a capacity to support 30,000 frames and is at present big using half that), seems to have become something of a hobby in itself for some of its users.

One of the obvious but largely unspoken aims of the editorial team is to make it into a communication base of computer users all over the country. Every Micronet subscriber has his/her own personal mailbox number, through which he/she can send messages both to Micronet itself and to other users. In this way people so inclined can set up a soapbox and pontificate, or can make microfriends. It's unlikely to develop overnight into a substitute for the good old postage stamp, though, because the person to whom you are sending a letter needs to be a Micronet subscriber and you need to know his/her mailbox number. Besides, you do expect people to open their post. Some users may not access their mailboxes for weeks.

Hardware

The hardware involved is both easy to use and inexpensive. For the BBC Computer, an acoustic modem has been produced but this is now being pushed out in favour of a direct connect one. Present users can buy a modem from £49 plus VAT — the price depends on the computer and includes software and a manual. Direct connect modems cost £69.95 plus VAT. At present the BBC micro is the main computer for which Micronet caters - simply because it was the first one for which the modem was developed. A special unit for the Spectrum, a little black box which clips neatly underneath it, will be available very soon. Other micros which will be able to access Micronet are the

THE ULTIMATE MICRO PRINTING MACHINE

Save the expense of a costly daisywheel. Eliminate the limited capability of cheap matrix printers. And get plotting in the process. Look at the advanced MT160 80 column and MT180 132 column multi-functional microprinters. You'll be amazed that such small printers can house so many facilities as standard.

Capability? You name it, these printers have got it. A report package puts you in the word processing world... letter quality characters, proportional spacing, margin justification, auto centering. A graphics package lets you plot whatever your micro wants to portray. The standard print mode lets you generate reports fast at speeds

up to 160 cps, and when it does this you have 8 different character widths to choose from.

There's more. Clip-on paper handling attachments let you use fan-fold forms, letterhead, or continuous roll paper. The control panel has a "menu select" for machine configuration and the MT160/180 are plug compatible to most micros. After all they have parallel and serial interfaces as standard.

In short, the MT160/180 are at the forefront of engineering excellence.

Give us a ring for full details or ask your regular microcomputer dealer for a demonstration.

Mannesmann Tally Limited, Molly Millars Lane, Wokingham, Berkshire RG11 2QT. Tel: (0734) 788711. Telex: 847028.

MICRONET 800

TRS.80 models I and III, RML 380Z and 480Z, PET (3,4 and 5 series), Apple II, Oric and, hopefully, ZX81 (a solution is being sought to the inevitable problems with the ZX81).

The Spectrum unit is rather neat. It eliminates the problem of noise interference caused through having to leave the phone off the hook by forming a 'bridge' between telephone line and TV through itself and the computer. This means that, as the call is taken from the line before it reaches the phone, you can hang up after you've got through. If you talk down a phone while it is transmitting data, you will get a screen full of garbage — it takes a lot less than that to interfere with data on a smaller scale.

The Lynx and Atari will not, at this time, be added to the Micronet list. 'The user base isn't big enough at present,' according to Robin Wilkinson, Editor-in-Chief.

One of the nice things about the Micronet modem is that it will conform to the Prestel standard of 1200/75 baud (1200 transmitting speed, 75 receiving) while allowing for 1200/1200 communication as well, which means you could use one of these modems to talk to your mate's computer over the phone. The modems are made by Prism Microproducts, Sinclair, Atari and Texas's distributor, a company in which Richard Hease is a partner.

Micronet itself also allows subscribers ful access to Prestel. The subscription fee to Micronet includes the Prestel cover charge, which is £5 per quarter. Micronet is £8 per quarter. This means a total subscription cost of £52 per year.

The first 10,000 users are entitled to a special offer which includes a free jack plug installation within 72 hours of joining Micronet. The price of the modem will probably have to rise after this number have been sold.

Unfortunately cost does put the service out of some people's range. When you add the price of the modem and all the phone calls you'll make over a year it does mount up. At present accesses to Micronet are very high — in April they were over one million — but it has been suggested that this will drop when people get their phone bills!

Usage

The way in which the 'have and have not' element could possibly be solved is by having Micronet in schools. Certainly it is educational in itself. Just in case there's any doubt as to its value in this area, part of the service is an educational branch. It includes educational programs, directories of educational software suppliers, computer courses and diary events and information from the Microelectronics Education Programme.

But there are practical problems with putting something like this in a school—you could only really have one terminal in a classroom (many more would be far too expensive to set up), and how many classrooms provide telephone lines? It is possibly the sort of thing which will appear in special rooms in some schools.

Plans for the future include business Micronet, which is already in its beginning stages. One feature of this service will be telex, enabling business users to send messages to each other without the receiver having to access Micronet to see it.

Business users can buy areas of Micronet and keep them closed from other users, thereby enabling confidential information to be transmitted over long distances secretly, and very quickly.

The teleshopping area of Micronet will grow bigger as suppliers overcome their preoccupation with the novelty of it and begin to act more adventurously. Telesoftware will expand and — before too long — there could be a Hong Kong Micronet, one in Australia and one in Boston, provided by clubs there using their own computer. The Boston scheme

is in the pilot stages.

The target for subscriptions is 12,000 by the end of the year. 'What really surprised us was the interest,' says Hease. The initial interest has been followed up by the rapid growth of an enthusiastic following. Jeremy Dredge, an estate agent, was Micronet's first ever user. 'It's opened the door to Prestel,' he said. 'I'm delighted with it'. He feels the friendly attitude of Micronet is what makes it such a success — and successful it is. Over 2000 subscriptions in two months and a 50 per cent reply rate on promotional mailings could hardly be called a failure.

Hease also agrees that Micronet's friendliness is a big part of its popularity. The chattiness is a conscious (but not forced) approach. 'We try to inject a bit of freindliness and fun into the whole thing,' he says.

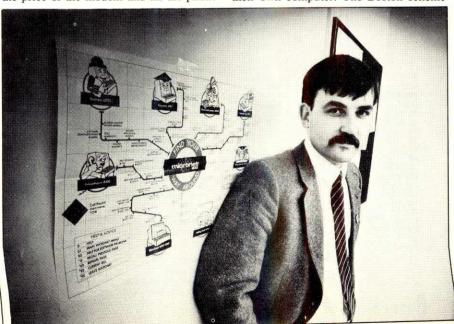

Other users also enjoy Micronet. Hilary Brindley, who has been accessing the database for about a fortnight, says she enjoys being able to download programs and explore Prestel as well.

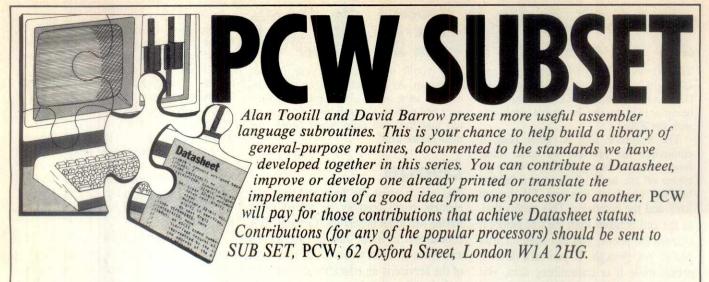

Conclusions

So people are having fun with it and learning from it. But does it actually bring people nearer to taking teledata into their homes, or is it simply another toy, confined to micro enthusiasts instead of comdirectors? Some Micronet subscribers feel that they would not be interested in Micronet or Prestel if they were not aware of microcomputing as well. It's also felt that big steps still have to be taken in this area before it is truly universal. There is a lot of potential in what Micronet represents which could be applied to other hobbies or businesses especially those which need the transmission of large amounts of information. The closed areas available on Prestel offer businesses a step into electronic mail which could make communication far more efficient and far less wasteful than it is at present — imagine having your old bulky filing cabinet transformed into a neat screen and keyboard.

Micronet, as it stands now, represents good value for money for all types of computer user and enthusiast. Some reservations have been expressed about the originality of the games supplied free, but there is the promise that more programs are being added all the time. It is very like a magazine in its approach (but not, by necessity, in its structure), and keeps up to date with the news much faster because it is updated rapidly and is available instantly. Since information is left in the database for some time users don't generally miss anything.

It's to be hoped that Micronet 800 will continue to grow and develop, possibly spreading a little out of the computer market and further into Prestel's idea of a universal information database. Certainly its friendly approach, and the amount of useful and regularly updated information within it, makes it an example which other viewdata services and information providers could do a lot worse than follow.

UNSPECIFIED 8085 INSTRUCTIONS

Concerning the unspecified 8085 op. codes reported by Jonathan Marten (*PCW* February), and Peter Caunt last month, Mark Hammes of

Loughborough finds, as did Peter, that 10 hexadecimal on his processor executes a 'SRA HL', a 16-bit artihmetic shift right, retaining the sign in bit 15

Z80 CUBE ROOTS

Last month we printed John Kerr's lucid account of root extraction, carrying on from Steven Weller's square root programs (*PCW* August, 1982). Now that you have all

had a chance to apply this thinking to some code of your own, here — as promised — are John's own Z80 cube root routines CURT1 and CURT2.

CASE OF MISSING INFORMATION

Apologies for the fact that 6502 processors across the globe have lain idle for three months while their owners contemplated CASEOF (as mentioned in April *PCW*). Below is the missing information to get those processors up and running again...

5502 CASEOF

Most readers of Sub Set will be familiar with the idea of the 'case' structure in which control is passed to different parts of the program depending on the match of a variable with associative keys.

Peter Villadsen of Copenhagen in Denmark provided Sub Set with a 6502 'case' routine, CASEOF. CASEOF searches through a table of addresses to routines, each of which has an associative key. If a match is found between the input variable in the X register and any key byte in the table, then a jump is made to the location whose address is held in the two bytes immediately following the matched key. If after a complete search of the table no match is found then CASEOF causes a jump to a location whose address could be an error message handler or other such routine to deal

The return address to the instruction following JSR

with no match.

Fig 1

CASEOF remains on the stack for control to be passed back to the calling program after the requested routine has been executed.

CASEOF needs the base address of the table to be in page zero memory before it is called and uses another two bytes of page zero memory to store the found address. By transferring the address to page zero in this way, control can be passed to the subroutine by means of an indirect jump.

The routine is not limited to any one table but the maximum table size it can manage is 84 cases. Using indexed addressing, no more than 256 bytes can be addressed and each case takes 3 bytes; one byte for the key and two for the address. Still, there can be very few programs that require case structures of greater dimensions.

The table format for CASEOF is shown in Fig 1.

```
TABLE : number of keys * 3 (ie, 3n)
TABLE +1, 2 : address of action 0 (no match)
TABLE +3 : key 1
TABLE +4, 5 : address of action 1
TABLE +6 : key 2
TABLE +7, 8 : address of action 2

TABLE +3n : key n
TABLE +3n+1, 2: address of action n
```

Z80 CASEOF

Andrew Bain of Welwyn Garden City who benefitted enormously from Peter Villadsen's ideas (see above) has sent in three Z80 routines along the same lines as CASEOF.

We give here two of them, CASOFZ and CASTXT. The first one, CASOFZ performs an identical task to CASEOF and uses a table format which differs from that used by CASEOF only by requiring the first table byte to give the number of keys in the table rather than the number of bytes.

CASTXT doesn't match single byte keys but whole strings using the concepts of Simon Sellick's routine CPSTR (PCW November, 1981) and, according to Andrew, could be used in writing a Basic interpreter. The table format differs in that the addess is given first, followed by a byte giving the string length, then the string to match. The final address (of the 'no match' routine) is followed by a zero or null byte and always 'matches' if no other match is found.

```

```

George Sassoon explores the code of public-key cryptography.

A few years ago, there were curious happenings at a meeting of a learned mathematical society. Armed security men burst into the lecture hall; fist-fights broke out around the podium; equations were hastily rubbed off the blackboard. The cause of it all? Someone had finally invented what security agencies dread most: the unbreakable cipher.

But all these efforts were in vain. The secret was out; and the basic principle of the cipher is so simple that one kicks oneself for not having thought of it first. Credit for that must go to three workers the Massachusetts Institute of Technology, Messrs Rivest, Shamir and Adleman. From their initials, the cipher is known as the RSA public-key cryptosystem. Why 'public-key'? The reason is that the key comes in two parts: the encryption key, which is made public, enabling anybody to encipher messages; and the decryption key, which is kept secret, enabling only the originator of the cipher to decode messages.

Until the invention of public-key sys-

tems, the only really secure cipher was the so-called 'one-time pad'. This is simply a pad printed with random numbers. If each sheet of the pad is used only once, then the system is 100 per cent secure; problems arise, though, in the distribution of the pads, which must be done by trusted couriers. If a pad is lost or copied en route to an agent in, say, Moscow, then the whole pad is compromised and must be replaced. The RSA system, with its two-part key, avoids this difficulty; the encryption key could be published in the Moscow telephone directory without compromising the system!

The separation of encryption and decryption is achieved by means of modulo arithmetic. The modulo function amounts to dividing one number by another, throwing away the quotient, and keeping the remainder. Thus 11 mod 3 is equal to 2, the remainder when 11 is divided by 3. Supposing that the original message, the plaintext, was '11', and the ciphertext was '2', the codebreaker has

no way of working backwards from '2' to '11'; the original message could have been 2,5,8,11,14. . . The RSA system uses this principle, but with very large numbers. In my implementation, the modulus is not 11, but a number in excess of 2^{240} , or about 1.77×10^{72} . The text is divided into blocks of 30 ASCII characters, each block being enciphered as a unit. Thus if the message is: 'ABCDEF. . .', it would be expressed for encryption as the number:

65 + 66 * 256 + 67 * 65536.

the final result being a number 240 bits (or 30 bytes) long. This is known as the plaintext number P.

The next step in the RSA system is to turn the plaintext number P into the ciphertext number C. This is done as follows:

 $C = P^E \mod N$

Where E, the encryption exponent, and N, the modulus, are the public part of the key, E is usually a prime number less than 20, and N is a very large number, in my case greater than 2²⁴⁰, which must be the product of two primes. The plaintext is thus multiplied by itself a number of times, and at each stage about half the number is thrown away. The result is the ciphertext. This is more or less equivalent to turning the message into alphabet soup, pouring it into a bucket, and then stirring it with a digital wooden spoon, spilling about half the soup with each stir. On the face of it, it would seem impossible to get back to the original message from the resulting mess of random-looking numbers. This is in fact true; it is impossible to work backwards to the original message, but it is possible to work forwards, using some mathematical trickery and the secret decryption exponent D. This can be illustrated by the simple example in Fig 1.

In this example, N is chosen to be 35, which is the product of 7 and 5, two primes. There are thus 35 possible 'messages', the numbers 0 and 34. The encryption exponent is chosen as 5, so each possible message is raised to the fifth power, being reduced modulo 35 at each multiplication. Some of the resulting ciphertext messages are unchanged, those adjacent or equal to exact multiples of 7, but the rest are thoroughly scrambled.

Decryption is then carried out according to the formula:

 $P = C^D \mod N$

That is, the ciphertexts are raised to power D, the decryption exponent, also modulo N. In this simple example, D is also equal to 5. The result of this opera-

tion is to restore the original messages 0 - 34.

This example is clearly trivial, but it illustrates how the original messages can be restored in spite of the modulo operation at each multiplication. All that needs to be done is to use the same principle for very large numbers, and then the system becomes a usable cipher.

Choice of exponents

In Fig 1, both encryption and decryption exponents were taken as equal to 5. These figures were arrived at by making use of one of the rules of modulo arithmetic. This states that when working modulo N, exponents are multiplied modulo phi(N), phi(N) being the Euler totient function of N. In normal arithmetic, for successive exponentiation, the exponents are simply multiplied.

 $(X^{E)}^{D} = X^{D*E}$

But in modulo arithmetic, the following

rule applies: $(X^E \mod N)^D \mod N = X^{D^*E \mod phi(N)}$ where phi(N) is the fearsome-sounding Euler totient function of N. The function is in fact very simple; it is the number of integers not exceeding N which are relatively prime to it. For prime numbers, the only such number not relatively prime to N is N itself, so for primes phi(N)=N-1. It can be shown that if N is the product of two primes P1 and P2, then phi(N)=(P1-1)*(P2-1).

In the example of Fig 1, the primes are 7 and 5, and phi(N) is 24. Now it is a basic truth that any number raised to the power of 1 is the number itself. So to select the encryption and decryption exponents, we need to select E and D such that:-

 $D^*E \mod phi(N) = 1$ Possible values of D^*E are:

25: equal to 5 * 5 49: equal to 7 * 7

73: prime 97: prime

121: equal to 11 * 11

145: equal to 5 * 29

169: equal to 13 * 13

etc.

Any of these pairs of factors would do for the encryption and decryption exponents. For demonstration, 5 and 5 were chosen, but in practice a small value for E and a large value for D would be chosen.

It will be seen that the exponents D and E are interchangeable, that is, you could equally well encrypt with the decryption exponent and decrypt with the encrypting one. This leads to another important feature of the RSA system, which is authentication of messages. Supposing our London office sends a message to their agent in Moscow, how can he be sure that it comes from London and not from Dzerzhinsky Square down the road? This is easily confirmed if the London office appends a block to the message which is encrypted using D, the secret decryption exponent. The man in Moscow can decrypt it using E, the public encryption exponent. If it makes sense, then he can be sure that the

message came from someone in possession of the secret exponent D, which can only be the London office.

Implementation of the system

The first requirement is for multiple-precision arithmetic routines, capable of handling very long numbers. Z80 routines were written, which can handle unsigned integers up to 2^{256} (over 10^{77}). Double this length is required for multiplications, so that each number occupies up to 64 bytes of memory. All the usual arithmetic functions are implemented, with the addition of 'powermod', used for evaluating the

expression:

 $Y = X^Q \mod N$

When Q is very large, it is not practical to do this with successive multiplications. Instead, Q is expressed as a binary number, and X is squared mod N for each bit of Q; if the bit is 1, then the result Y is multiplied by X. Thus to evaluate X¹¹,

 $Y = X^1 * X^2 * X^8$.

With this system, decryption of a 30byte cipher block takes about five minutes, using a bog-standard Z80 running at under 2 Mhz clock rate.

But before there can be any encryption and decryption, ciphers must be created. Two prime numbers must be found, whose product is in excess of 2²⁴⁰, and

GOTO page 204

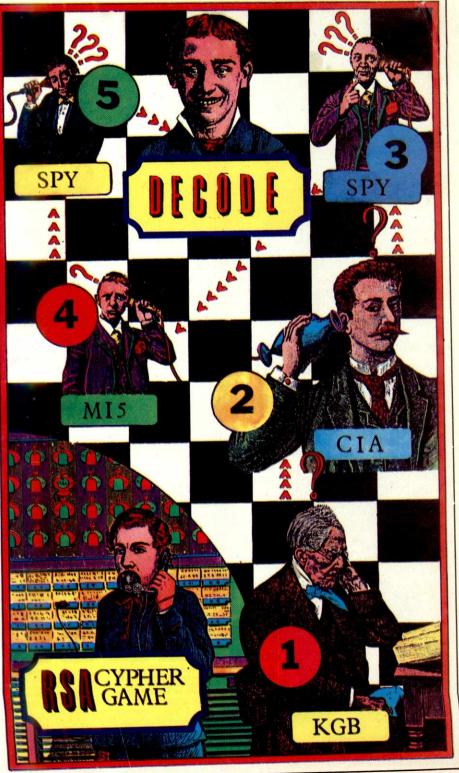

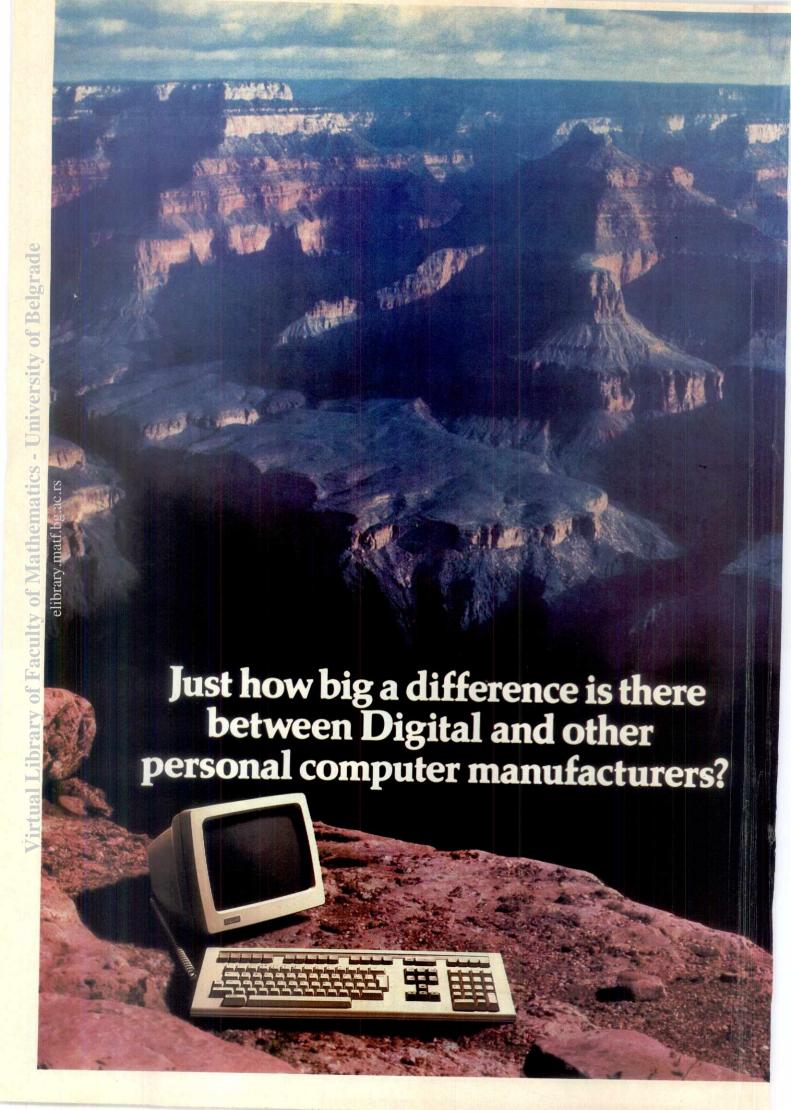

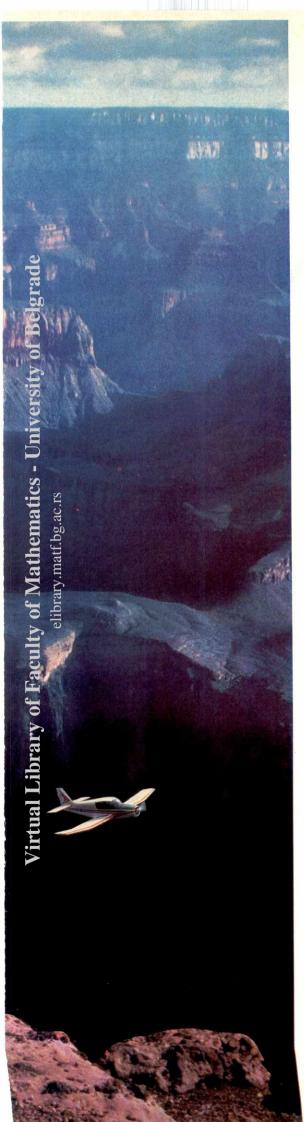

Illustration by Mike Litherland

The gap, believe us, is wide.

And the confusion surrounding personal computers, widespread. Because the term 'personal' computer now stretches to include a multitude of machines, with a diverse range of functions and capabilities.

So let's set the record straight. And get down to business. Over the past quarter century Digital's main objective has been to personalise the computer. Permitting direct access to *real* computing power to whoever wants it.

And in that time Digital have introduced minicomputer power into banks, mines, steel plants, farms, refineries, aviation, broadcasting, universities and assembly lines to name but a few.

Digital were also the first company to mass produce minicomputers, and the PDP-11 is, in fact, the world's most popular minicomputer today.

A fact that makes Digital the world's largest manufacturer of minicomputers. Which, in turn, makes it less of a surprise that Digital have now developed a range of personal computers unrivalled in their ability to meet today's professional requirements. From the dual microprocessor Digital Rainbow to the highly advanced Digital Professionals, the first personal computers with the ability to perform numerous functions at once, there's a Digital personal computer to suit practically any need.

And the Digital difference becomes even wider when you consider Digital's unique service back-up, which includes access to our Customer Information Centre, service support, software services and maintenance. And in the unlikely event of anything going wrong, Digital guarantee to deal with any problem, on site, within 8 working hours anywhere on the UK mainland.

Plus you automatically get a free 12 month warranty to cover all our hardware and software.

It's a service record that is, in fact, unrivalled by any. If you'd like further information about Digital professional personal computers ring Digital on Basingstoke (0256) 59200 or contact any of the Dealers shown overleaf, then compare the facts with any other machines to see just how wide that chasm of difference really is.

You'll end up on our side every time.

Doing more. The Digital difference.

1983 READER SURVEY

YOUR CHANCE TO WIN A SHARP MZ-711

Yes, once again it's time for the *PCW* Reader Survey, and once again we have a sparkling new micro to give away to the first name out of the hat! The star prize is a Sharp MZ-711 personal computer. It has 64k of RAM and it's one of the latest MZ-700 series announced by Sharp. A further ten lucky readers will receive a year's free subscription to the best micro mag on the market! Don't worry if you already have a subscription — we'll simply extend it for a further year.

Virtual Library of Faculty of Mathematics - L

The reason we have these annual surveys is to keep us in touch with what you want from the magazine. We do meet readers from time to time, of course, and obviously we receive a lot of letters, but this Survey gives us the chance to analyse the views of as many readers as possible. If there's anything you particularly love or hate about PCW, new ideas you'd like to see included or regular items you think we should drop like a hot brick, here's your chance to let us know.

The Survey is used to plan the future of *PCW*, so this is your chance to take an active part in choosing the direction we're going to be moving in over the next year or so. The prize draw will take place in mid-August so the questionnaire should be returned as quickly as possible. Our thanks to Sharp for providing the prize and to you for completing the questionaire.

Moore on Kuma

Forth First

Kuma believes it is the first in the world to offer a 68000 based Forth which includes an assembler.

This professional software product is written by Kuma and we fully support it all the way. It comes complete with a floating point package and an assembler for £385 plus VAT, for the Sage

Forth is a high level language particularly suited for machine control. Its "self-extending" facility allows you to custom build your own language by permanently embedding routines in the software.

Having mastered the Sage Forth we are interested in implementing this on other 68000 based machines.

Forth on MSDOS

With the trend away from CP/ M 86 to MSDOS, has meant that we have now implemented our Forth for Sirius 1 on MSDOS

Gentronics Interface

A special interface is available from Kuma to convert the RS232C serial interface on the NewBrain to Centronics. So if you have a Centronics printer, you can now interface it with the NewBrain without any problems. Price is £99.50 plus VAT.

Similar interfaces (serial to Centronics) for other machines are in the pipeline and will be announced shortly.

Sage & CBM64 **Franchises**

Kuma is now a franchised dealer for the 68000 based Sage and the Commodore CBM64. Now you can not only buy the hardware from us but look forward to the high level of software support we give all our machines.

Sharp Colours

For just over £2000 plus VAT, Kuma can offer you the exciting MZ3541 colour machine. A twin disk, CP/M computer with 128K of main memory and a large spread sheet calculator capability. It's every bit as good as you expect from Sharp.

Pascal Update

Hisoft Pascal for Sharp MZ80A is up to version 1.5 with the notable inclusion of printer

News Bits

- * An assembler written in machine code is available from Kuma for the NewBrain.
- Our June NewBrain catalogue is ready. It's free and contains details on the new assembler and other utilities.
- The popular 4D game has been computerised for the Sharp. More details in our new MZ80A brochure.
- We have a very useful program called TX for transferring CP/M files. It runs under CP/M on Sirius 1, Osborne 1 and MZ80B.
- MZ80A and B users can have the new Kuma dual port RS232 interface card for £130 plus VAT.

HX-20 User Graphics

Special characters for mathematical and scientific symbols, foreign letters, etc, can now be defined by the Epson HX-20 user easily and quickly with a £17.50 (plus VAT) package from Kuma.

After defining, the characters can be directly used or saved to tape for transfer to other programs.

Low Cost Word Processor

Kuma's WDPRO word processing package continues to be our top selling program for the Sharp MZ80A. For £39.50 or £79.95 plus VAT respectively for the cassette and disk versions. you have a superb low cost word processor. And the recent addition of MAILPRO means names and addresses can be merged with WDPRO created documents.

New for HX20

Get our new programs in the DESK MASTER series.

They are a Data Base (16K or 32K versions), Mailing List, and labelling packages.

Other items in the successful DESK MASTER series are a Spreadsheet Calculator and Word Processing Packages (both of which are now market leaders for this machine); Office Aid; Friendly Terminal; and Decision Maker. The last is a selection aid where multi-parameters with different weightings are applied, eg in staff selection.

Last but not least, there is the DESK MASTER editing terminal on the HX20. We are now leading Electronic Mail Box ante en if voluma

Kuma Computers Limited

A Combination of Soft & Hardware

SITIUS 1

New Brain CE commodore OSBORNE1

IBM COMES FORTH

An exclusive review of PolyForth as presented by Dick Olney

As the popularity of Forth among micro users increases so, too, does the number of compilers available. The problem is that either they are cassette-based or they run under one of the standard operating systems, both of which situations disguise the language's full potential.

PolyForth, from Forth Inc of California, is unique in providing a standalone multi-tasking operating system and an overwhelming selection of extensions and utilities for a mere £250. It was designed to run on an IBM PC with at least one single-sided disk drive. A conversion utility is included which allowed me quickly to reconfigure the software and make full use of the dual 320k drives installed in the machine I was using.

The PC automatically boots up the PolyForth when it's switched on, whereupon a title and date appear in the top left-hand corner of the screen together with the word 'HI'. At this point the Forth nucleus', that is, those words which are precompiled on the system disk, is already in place and most of the major features have been loaded (like any good Forth all the non-standard extensions are supplied as source). Typing 'HI' at this stage loads a further selection of utilities and displays a help screen containing brief details of a selection of useful commands.

MS-DOS users might be rather disturbed at this point to find the cursor and edit controls on the numeric pad completely disenabled (the keys always echo their number value). This is because these functions - like the rest of the keyboard are dealt with in software. In fact the Forth has a keyboard interpretation chart residing in block 0 of the system disk. The version I used was still configured to a US keyboard. The " and @ sysmbols were reversed and the £ returned a #. Comsol, the European distributor of this product, is working on a UK conversion utility to be included in the package. It is possible to use all of the special keys but you'll need to develop your own routines to handle their functions. The ten keys labelled F1 to F10 can be attached to a word simply by naming it with the legend on the key as in: F1." This is Function F1"; which will cause the embedded text to print out whenever the F1 key is depressed. For other keys, however, such as CTRL and ALT you'll need to test for ASCII values in a special input routine.

The basic system includes most standard Forth words and much more besides.

existence of a word and the command LOCATE will automatically display the source of any word loaded from disk not contained in the object nucleus — an invaluable debugging aid. A full selection of 32-bit maths operators is included as well as an 8088 assembler — written in Forth — and a standard line editor.

As is usual the assembler and editor words are held in discrete vocabularies which must be declared before they are used. A further 5 user vocabularies can be added. The system keeps track of these using an array called GOLDEN which contains the start (or end, depending on how you look at it) of the dictionary lists. At any one time up to four vocabularies can be current, with the compiler following a pre-specified search sequence determined by the contents of the variable CURRENT. Used in conjunction with the turnkey compiler (see below) this enables the programmer to create a self-loading application where the user can only access an appropriate selection of high level commands.

A copy of the GOLDEN array, called CONTEXT, has its link addresses updated as new words are added to the various vocabularies. The word EMPTY copies the contents of GOLDEN into CONTEXT, thereby erasing from the dictionary any entries compiled since its previous execution. The source for this reads GOLDEN CONTEXT 20 MOVE. phrase CONTEXT reversed GOLDEN 20 MOVE re-initialises GOLDEN thus protecting all currently compiled words from the use of EMPTY. In this way applications can be efficiently re-compiled during development and protected after successful debugging using a technique which is much more controlled than the traditional FORGET.

All dates in the system, including today's, are held as 16-bit numbers described as 'modified Julian dates' giving the number of days which have elapsed since 1 January, 1900. They use a compact representation which allows arithmetic to be performed on the date directly. Two formats are provided for input and output of which examples are 14 MAY 1983 or 5/14/83. Little effort has been put into conversion for the British market though it would be no problem to develop your own routines using the existing low level

Multi-tasking

because of its ease of use. It relies upon a tiny (25 bytes) core routine called PAUSE. When executed in a program this word passes control to an idle loop which runs around a circular chain of addresses called a 'round robin' searching for the next task ready to be activated. New background tasks are created using three programmer-supplied values. The first of these represents the 'user area' in which key variables may be protected from other tasks. Such variables are defined in the format:

offset USER name

where the offset is added to the task's base address to give the address of the variable. Each task maintains its own parameter and return stack, and the other two values represent the byte sizes of these. To define a background task the command is:

user parameter return BACKGROUND name

which constructs a table to be used when the task is initialised with the word BUILD, whereupon it is linked into the round robin.

Once a task has been defined and created it can be activated by any program using the following convention:

word task-name ACTIVATE (words executed by task);

There are, however a number of vital restrictions of which the programmer must be aware if this is to be successful. First a background task cannot perform terminal I/O and is thus unable to issue error messages, so if anything goes wrong the whole system will crash. A similar effect occurs if the task is allowed to reach the semi-colon, and it must therefore be explicitly terminated with the word STOP.

The reason that a background task cannot perform terminal I/O is that such a potential demands the ability to vector to unique routines when executing words like TYPE and CR. It is possible to overcome this by moving text directly into screen memory, but you'll need to develop your own routines in assembler to access memory above 64k. The two predefined tasks called OPERATOR and TYPIST are, of course, capable of terminal I/O since they control screen and printer respectively. This means that screen activity remains relatively unaffected when the printer is active.

Although the multi-tasking facility is simple and effective much of its operation depends on the programmer. Remember

Announcing more exciting programs for the BBC.

Acornsoft is the software division of Acorn Computers, the company that designed and built the BBC Microcomputer. Here are four more exciting programs, all designed to get the most from your BBC Micro.

Starship Command (£9.95) is a demanding high-resolution graphics game in which you command a starship against attacking alien ships. You control the forward drive and rotational thrust of your ship, which is equipped with shields, long and short-range scanners and a sector display of the stars and alien ships.

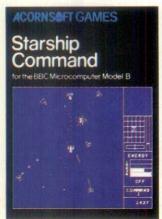

Countdown to Doom (£9.95) is a race against time as you strive to repair your damaged space ship in the corrosive atmosphere on the planet Doomawangara (Doom). Beat the clock or resign yourself to a life in the wilderness of Doom.

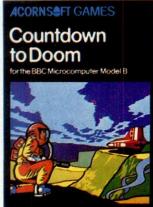

Business Games (£9.95) is a cassette containing two games designed for economics, business or general studies teaching.

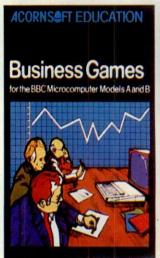

In Stokmark, up to eight players compete in buying and selling shares aided by a screen display of relevant market information.

In Telemark, players compete to dominate in the manufacture and sale of televisions. The winner is the one who makes the largest profit or controls over half the total market.

Jars (£11.90) is an educational cassette suitable for 7-13 year olds. The objective of the program is to present, what are usually thought of as purely numerical problems, in a visual way. Jars of liquid are used to visualise volume estimation and fraction problems. Success, partial success or failure is noted by a scoring system and suitable comments.

How to get Acornsoft programs.

If you're a credit card holder and would like to buy cassettes of the programs shown in this advertisement, or if you would like to know the address of your nearest stockist, just phone 01-200 0200.

Alternatively, you can buy the cassettes directly by sending off the order form below to:
Acornsoft, c/o Vector Marketing, Denington Estate,
Wellingborough, Northants NN8 2RL.

Also use this form if you would like to receive the current free Acornsoft catalogue.

Please allow 28 days for delivery.

IBM COMES FORTH

ground tasks to use PAUSE in a fashion most appropriate to the application. In addition the use of any shared resources, such as the disk buffers, must be carefully monitored and, if necessary, controlled using special routines. Note that, once built into the round robin task, definitions cannot be erased from the memory by EMPTY or FORGET and any attempt to do so has dire consequences.

Despite the vulnerability of the PolyForth multi-tasking, it does give this sytem an immediate lead over most of the more conventional operating systems currently available. Used properly with careful and extensive debugging it could provide the basis for many impressive applications.

Programmer Utilities

The initialisation of diskettes and the manipulation of data on them is fundamental to any disk-based operating system.

In this system these functions are grouped in a utility dubbed 'Disking'. All the standard commands are provided including initialisation, backup, and block copying as well as disk diagnostics. One command that is particularly useful is MATCHES, which is not used to activate are optional cigarette lighter, but to compare the contents of two specified ranges of blocks and report any discrepancies.

The most common criticism of Forth is that the source is unreadable to anyone but the originator. Forth Inc has attempted to counter this with a facility called 'shadow documentation'. Two disks are supplied with the package, the system disk which resides in drive 0, and a documentation disk for use in drive 1. The documentation or shadow disk contains brief descriptions of all the words existing as source on the system disk. To access the shadow blocks you must first LIST the relevant source; at this point the command Q will toggle the display between the source and its associated documentation. This idea is that shadow documentation is written at the same time as the source to assist in any future modification or debugging.

The printing utility makes use of the shadow documentation by allowing double-sided printing. With careful positioning of the paper the source and shadow blocks can be printed so as to appear opposite each other when filed in an A4 binder. Alternatively, source without shadow documentation can be laid out with alternate pages on different sides of the paper to give a similar effect.

Printing is initialised by preceding any valid words with the command PRINT. This literally sends the rest of the input stream to the TYPIST terminal task. Because of its mode of operation, however, this word cannot be used inside colon definitions, where TYPIST ACTIVATE performs a similar function. The system gives full support for the standard IBM (Epson) parallel printer, though you need to wirte your own control functions using EMIT and the ASCII values

given in the IBM Guide to Operations.

Additional Options

To complete the image of this package as a powerful software development tool, a number of additional support features have been included. One of the most exciting of these, especially bearing in mind the multi-tasking capability, is the colour graphics option. Unfortunately, I do not have access to a colour display so I was unable to use this facility, though I did see a demonstration on one of IBM's machines which drew some fairly convincing square spirals. The option allows basic point plotting in medium-resolution (200 x 320) colour mode. From the manual I would guess it's fairly primitive but, like the rest of this system, I'm sure it could be extended into a powerful vocabulary.

Another option is the screen editor, which uses all the IBM function keys, and which I used to write this review. It's better than using my old typewriter but lines do not run on, neither do blocks, so it's hardly a word processor. Nevertheless it serves its purpose and perusal of the source reveals an interesting definition of a word named :K which reads: :K (k): LAST @ @ CFA 2+ SWAP 'FUNCTION'

The colon within this definition means that upon execution: K will itself cause a new word to be compiled from the input stream, and it is at this time that the colon is presented with a matching semi-colon. When: K encounters the latter compilation ceases and the rest of the code is executed. The technique is used here to place the execution address of a colon definition into a function table at the time it is compiled, thereby facilitating vectored execution. The word: K expects the offset in the table for the new word to be on the stack. An example of its use is: 71: K HOME 0 C#! 0 L#!;

where HOME places the cursor at the first position on a block by zeroing the column and line counts.

Although IBM apparently does not support it, there is a spare socket on the system board for an 8087 maths processor, and the PolyForth manual gives full instructions for installation and details of an extensive supporting vocabulary. The conditions of sale from IBM, however, suggest that such a modification would render the warranty invalid, so I resisted the temptation to test out this option.

If applications are to be written in Forth, then sooner or later they are bound to be presented with files created under PC DOS, and the next option on the list is PC DOS file handler. All this really does is to take care of the DOS sectoring and provide for basic file manipulation. Actually to access data in applications you'd need to extend considerably the vocabulary. Still, the basis of it is there and it would be fairly easy to impose your own data structures over the DOS format.

Last, but not least, is the turnkey compiler which allows self-booting application disks to be created. This is achieved by first EMPTYing the dictionary then loading up your applications, followed by the

turnkey utility. At this point a controlling application word to be executed on entry can be specified together with any blocks to be loaded from disk at that time. The word PROGRAM then transfers a custom bootstrap dictionary to an initialised diskette in drive 1 (instructions are also provided for generating turnkey diskettes on single drive machines). Applications, using a startup program in conjunction with sealed vocabularies or closed program loops, can effectively deny a user access to the Forth itself, even though the core code is resident in the application. If Forth Inc is convinced that you've done this properly then the company won't claim for any copyright payments.

arithmetic	4.1
mixed maths	5.3

I timed the PolyForth using the Forth benchmark programs published in the January issue of *PCW*. To do this I had to write an assembler routine to reset the stack pointer, which luckily turned out to be very simple (my assembler is limited to say the least!) and my version of SP! reads:

CODE (SP!) S POP NEXT: SP! SO @ 2 - (SP!);

Having checked the reliability of the system clock I decided to let the machine time itself and printed out the contents of the system variable TICKS at the beginning and end of the multiplier routine. Remember that the timing for this word is subtracted from the other values to give the true figure so it doesn't matter that my version takes slightly longer.

The results are the fastest recorded Forth benchmarks, particularly the arithmetic program which this system runs four times faster than its nearest competitor. An additional test of my own, using double-number and mixed operators, ran almost as fast as the original arithmetic program. There's no doubt that if it's speed you're after then this is the package for you. (For 'mixed maths' benchmarks, see below.)

ATARI 800,™ no price increase, upgraded from 16K to 48K RAM.

Virtual Library of Faculty of Ma

Less &'s.

ATARI 400TM reduced from £100 00 (SRP inc VAT) to £159 99

It's hard to know which set of figures is more attractive. Certainly the ATARI 800™ Computer, upgraded by an astonishing 32K without any increase in price, will have its admirers.

However, £40 off the ATARI 400[™] Computer makes it remarkable value for money, particularly when you take into account its 16K RAM (on some computers you'll be charged extra to upgrade to 16K).

It's even more remarkable when you look at

our computers feature by feature.

The Family Computer.

Before we designed them, we thought about

who was actually going to use them.

One day our computers might be playing games; next, they're wrestling with household budgets; teaching geography to an 8-year-old; or printing letters.

In other words, we designed our computers and software for as many applications as a family has ideas. (Now the ATARI 800 Computer has 48K RAM, there's even more memory for even

more applications.)

Next we built in high-resolution graphics. Inside our computers, we have a microprocessor whose only job is to operate our graphics.

All told, you can choose up to 16 different colors in 16 intensities, which gives you a

spectrum of 256 different shades.)

In fact, our computers divide the screen up 60,000 tiny points, each one of which can be changed without affecting the other.

A friend not a fiend.

We also looked at ways to make computers rather friendlier.

On the ATARI 400 Computer, we've incorporated touch-sensitive keys with ridges, so fingers won't slip; on the ATARI 800 Computer, we have keys much as you'd find on a standard typewriter.

You can talk to your computer in a choice of languages (five for the Atari 400, nine for the Atari 800), including ATARI BASIC, using software which you load in on cartridge, cassette, or disk.

For our computers, we have one of the largest software libraries in the world: everything from speech synthesis to sophisticated data management.

No doubt you know all about our famous games such as PAC-MAN[†], SPACE INVADERS[†] and STAR RAIDERS,[™] winner of the 1982 Game of the Year Award.

However, we also boast home and office application software as well

Atari 400 and 800 Home Computer Technical Specifications.

Colour Capabilities: Choose from 16 colours, and 16 intensities (up to a total of 256 shades).

Sound: Four independent sound synthesisers for musical tones and games sounds. Three and one half octaves. Variable volume and tone for each voice.

Display: Three text modes: 24 lines of 40 characters, double-width characters, or double-height, double-width characters. Nine graphic modes: from 40 columns by 24 rows up to 320 columns by 192 rows.

Memory: Includes a built-in 10K Read Only Memory (ROM) Operating System with 48K Random Access Memory (ATARI 800) and 16K Random Access Memory (ATARI 400).

C.P.U.: 6502B Microprocessor 0.56 micro-second cycle. 1.8Mhz.

Special Features: Three customised integrated circuits.

Extended Graphics Functions: High-resolution graphics. Multi-coloured character set. Software screen switching. Mixed text and graphics modes.

Multiple re-defined character sets. Player missile (sprite) graphics. Fine screen scrolling in any direction. Changeable colour registers. Smooth character movement.

Peripherals: A range of peripherals and accessories that are available now.

as educational programs to satisfy the most enquiring mind.

You can learn French, Spanish, German or Italian on our computers and through our unique 'sound through' system you'll hear the language and learn it the way you learnt your mother tongue. (Other computers will leave you speechless.)

You can teach yourself touch typing, compose and play your own music or teach a

child the alphabet.

On another program you can find out if your current mortgage is giving you the best value for money; while yet another program will answer a question that has vexed mankind for generations: "Where does all my money go?"

At the same time, the outstanding VisiCalcongram is available for the ATARI 800 Computer.

Write your own programs.

As if all that isn't enough, through Atari's Program Exchange (APX), you can have access to a wide range of the most imaginative programs written by our users.

Or you can learn to write your own programs with the help of our 'Invitation to Programming' series, using our unique sound through' system.

Surprisingly, you won't have to plough through a small library of manuals to do so, since most of the series is on software, not in hard books. Of course, we've always had just about everything you're looking for in computers.

From today, we've got even more.

More of what home computers are for.

IBM COMES FORTH

Documentation

Very sensibly Forth Inc has used the superb Starting Forth as one the manuals for its PolyForth. This book has become the Forth programmer's bible, providing the beginner with a detailed overview of the language and many useful examples. The other manual supplied with the package, held in a solid foam-backed binder, contains general details of specific features, though really to understand how everything works you'll need to read the shadow documentation as well. Everything is covered and the manual includes an excellent index and glossary, as well as full source and shadow listings.

Expandability

Level 2 PolyForth is at the bottom end

of a range of three products. Level 3, which costs £490, includes a database system and support for multi-terminal tasking and networking. It also includes a much more detailed manual. The most expensive system, Level 4, adds a target compiler and carries full source listings of all words. It costs £2750, but this buys you certain rights of reproduction as well. Unfortunately, you get no discount on Level 3 if you've already got a Level 2, though full discount is offered when upgrading from Level 3 to Level 4. It is, however, possible to write most of the features included in Level 3 with the facilities available in Level 2.

Conclusion

As you may have guessed, I was extremely impressed with this package. Forth remains (in this country at least) relatively unexploited as a serious software development tool, partly because

many of the compilers available are simply not suitable for this purpose. Level 2 PolyForth is a quality product aimed at the professional or semi-professional programmer (at a price that should present no problem to anyone who can afford an IBM PC!). How successful it is in competing with the mainstream languages and operating systems will depend to some extent on the marketing, an area about which Comsol is still hazy, though it has been submitted to IBM for approval. I do know that the company plans to go all out in the autumn, and is looking for big sales to make the venture worthwhile.

END

TOP SECRET

continued from page 191

the exponents E and D selected. Primes are found using the so-called probabilistic prime test, which can find a suitable pair in the region of 2120 in an hour or two. Exponents E and D are then selected according to the procedure outlined above. Fig 2 gives details of one cipher, RSACOD2. The ciphertext is in alphahex code, where the letters A-P represent the numbers 0-15; two letters of ciphertext corresponding to one ASCII symbol of plaintext. Thus a 30byte block of plaintext enciphers as 12 five-letter alphahex groups. The plaintext may include carriage-returns and other control characters

Security aspects

To break an RSA code, it is necessary to find the factors of the public-key modulus, N. When the factors are known, the Euler totient function phi(N) can be calculated, and the decryption exponent D. Finding the factors of very large numbers is extremely time-consuming if there are only two large factors. By comparison, finding large primes is very easy. Thus the present system can find primes in the region of 10³⁴ in an hour or so, yet it took over 48 hours to find the factors of a number in the region of 10²¹ using the efficient Monte Carlo method.

As the numbers get larger, the difficulty of finding factors increases as the 0.25th power of the number, but the difficulty of finding primes only as much as the cube of the log of the number.

So, the longer the numbers, the greater becomes the difference in computing power needed between creating a code and breaking it. Hellman has estimated that with N in the region of 200 decimal digits, the best computers in the world would take over a billion years to break it. The present Z80-based system could easily be adapted to accommodate numbers that length, at a cost of a 30-fold increase in encryption and decryption times.

There is also the brute-force approach to breaking the code, which consists of trying every possible plaintext input and seeing which one gives the known ciphertext output. Even with the present system, trying 10¹² plaintexts per second would take about 10⁵² years to work through all possible combinations. Despite intensive world-wide efforts, no easy way of cracking RSA ciphers has been found, and it seems unlikely that one will ever be found.

There has recently been controversy as to how unbreakable this code really is. PCW would be interested to hear actual experiences of breaking it.

Applications

Up until the present, the use of ciphers has been confined to military and

diplomatic circles but, as Hellman points out, the proliferation of electronic communications has led to more and more confidential information being transmitted over insecure channels. It is easier to tap into a telephone line than to open a sealed letter without detection. Due to this, it is likely that more and more private individuals and organisations will resort to the use of ciphers, and if this happens then RSA ciphers and microcomputers will be sure to play a large part.

Acknowledgement

I am greatly indebted to Robert Macmillan of the University Mathematical Laboratory, Cambridge for helpful advice and for having sent me a draft copy of his dissertation.

512 x 512 GRAPHI

Digisolve offer you a way to increase your graphics speed and resolution. Using a high speed graphics processor, our cards draw lines and characters FAST. The graphics processor works in parallel to the host machine, and gives you the power of using a co processor specifically designed for graphics. With drawing rates of up to 1,500,000 pixels per second, lines

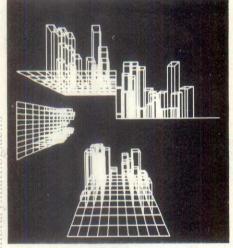

appear instantly to speed up your plotting.
With the resolution, we offer new possibilities for software and systems. No longer is it necessary to consider one of the new 16 bit personal computers because of their better graphics. Digisolve offer a card designed for the Apple II to give 512 × 512 monochrome graphics. With the development of an 80×57 line Visicalc and Applewriter pre-boot, serious business users are no longer finding 80 column cards good enough. We also offer a colour unit designed to connect to any computer to give the same resolution but with 64 colours.

Digisolve are committed to the development of graphic systems and character display equipment and have a rapidly

growing software base to help you use better graphics.

APPLE II CARD

APPLE II

Digisolve's Apple II High Resolution Vector Graphic Processor Card quadruples the screen resolution and saves using up your Apple's memory space. The enhanced Applesoft support disc supplied with our card provides the powerful graphics functions and simplifies the conversion of existing software.

* Draws vectors at up to 1,500,000 pixels per second

* 512×512 pixels resolution

Graphics and characters mixed, allows proportional spacing and up to 85 characters by 57 lines of text

64K bytes of on board memory will store two pictures for animation or have one text and one graphics page

4 different line types for clarity

* Blocks of variable sizes may be drawn to speed up area filling

Read modify write mode for drawing cursors

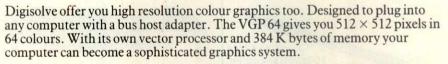

Screen read mode for dumping drawings to a printer

* £399 + VAT + P&P

SOFTWARE: Visicalc and Applewriter pre-boot. Architectural Design & Modelling. Kitchen Design. Draughting. Report Presentation.

Turtle Graphics, TASC & Apple Soft software support.

- * 64 colours that may be expanded with a pallette or extension video RAM card
- 512×512 pixels resolution with fast vector processor

384 K bytes of video RAM on board

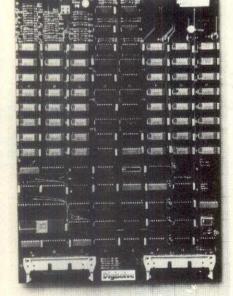

2 pictures may be stored simultaneously in full colour for animation

In monochrome 12 pictures may be stored and selected for display under software control individually or for animation

Available as a boxed unit complete with power supply, or in board form to **OEM** customers

Will plug into Apple, Commadore, IBM, Sage, S100 systems, PDP11 or any computer with a bus

Available in several versions: 8 colour £799 64 colour £899

A PSYCHOLOGICAL APPROACH?

Paul Overaa introduces a four-part series on programming with an analysis of the more modern ideas and approaches in problem-solving.

There are so many methodologies scattered around under the terms 'structured approaches to problem solving' or 'structured programming techniques' that we are all apt to look upon new ideas and thoughts on how we should program with a certain amount of contempt. Frequently such contempt is justified because writers often rehash the work of others using a different terminology, or an alternative name simply for the sake of doing so. When I first thought of preparing this series I was motivated primarily by the desire to collect together some of the more important ideas that have appeared over the last few years. It is my opinion that there is not enough emphasis placed on how these newer techniques are evolving to form a consistent framework within which many of the older concepts are finding new life.

There is always a tendency for ideas, once useful, to be pushed both theoretically and practically to their limit. This is a good thing at times but I suspect that very often the initial simplicity of an idea becomes 'couded'. People unfamiliar with the original thoughts have difficulty working out the basic concepts. In programming, and computing in general, this constitutes a major obstacle. So it is appropriate to take stock of the various developments in a way that can provide a general picture.

We can start by examining some very general points that are closely related to the field of computer programming. They are concerned with how we think and solve problems. More importantly they give some clues about how we react or behave when we encounter difficulties.

Solving problems

Motivation is one key to accomplishment. Another way to learn about any new subject is to 'break it up into manageable pieces'. Each piece is then far less formidable and consequently far easier to get to grips with.

Inherent in this idea is the implication that an ordered or 'structured' approach exists that enables our understanding of the lesser problems to be integrated into our understanding of the original, more complex, ideas and problems.

The microcomputer has brought us sophisticated computing power. No longer are computers the 'gods in the sky' to be admired with awe. The computer is now a readily available tool that can be used by all of us irrespective of our professions. It can save us time, increase our productivity or

allow us to indulge our own creativity 'just for the fun of it'.

So you have a computer, or access to one; you have instruction manuals and books that explain how you physically program your computer; you start learning by 'hands on' experience — writing programs and experimenting with problems and uses that interest you. Gradually you come to terms with the vocabulary of the subject and you become aware of what a powerful tool you are working with. Such awareness serves to increase your desire to learn, to increase your motivation to master a seemingly complex subject.

As you start to tackle larger problems you will have become aware that difficulties arise. These difficulties are solved with much effort and diligence (yes, it is quiet in the early hours of the morning). As frequently as not you find yourself looking over large amounts of coding in an attempt to locate a 'bug' that is preventing your program from working. If you are examining a program that you wrote some time ago, the problem is even more exasperating — especially if you did not document it properly. In more unfortunate cases you get involved with trying to understand programs that have been written by other peo-

'People unfamiliar with the original thoughts have difficulty working out the basic concepts.'

ple. I'm sure that many of you will have come to the conclusion either that every programmer is a latent masochist or that there must a better approach to use.

Emphasis on 'structured programming' is an important step in the right direction but it is not in itself the complete solution. This is owing to a serious fundamental error continually made by both professional and amateur programmers alike. The difficulties in programming a computer to solve a particular problem consist of two very distinctly different parts.

Failure to appreciate the difference between the inherent logical basis of the problem, and the completely separate problem of how to code it, is one of the major causes of bad programming. It is one of the reasons why so many people run into problems as they start to tackle larger projects.

The point made in the previous paragraph has a clear corollary:

Any envisaged use of computers to solve a problem requires that you find a logically correct solution before you make any attempt to involve yourself with the problems of actually coding your computer solution, that is, you should not try to solve the quite separate difficulties together.

It has consistently been found easier to tackle each part in turn. The isolation of a logical program design produces a logical solution that is portable. It is independent from the computer hardware and software on which it will be implemented.

My concern then is about the techniques of solving problems and designing the logical solutions needed to produce efficient and well structured programs in any language you care to name. If you are a newcomer to microcomputing, then take heart. Although some of the ideas may take a certain amount of time to digest, they are fundamentally simple. Be patient and think about the concepts. Apply them to problems of your own choosing and you will achieve a real and useful understanding.

Iconic modelling

The way in which we approach a problem plays an important role in determining how successful or not our solution will be. In the last twenty years much work has been done by psychologists to try and discover the basic mechanisms we use when we solve a problem. In general, what mechanisms do we use to come to terms with our intellectual and physical environment?

Jerome Bruner has attempted to describe and characterise the ways in which young children react when confronted with a problem. He was able to identify three broad stages in the problem-solving experience. The words used by Bruner — enactive, iconic and symbolic — can be thought of as keywords for a basic problem-solving framework. This framework is applicable to adult as well as children's patterns of thought.

Enactive: relates to the use of physical models and the ability and confidence to manipulate them. One of the characteristics of this enactive level is an inability to describe the situation — that is, the inability to communicate effectively without resorting to actual demonstration.

Iconic: the second recognisable stage is the use of diagrams or pictures to represent the 'enactive elements' of the problem. This has been called the iconic stage and is sometimes seen as the initial stage of abstraction, that is, separating the physical or real problem into a 'modelling situation'.

PCW 207

SUBSCRIBE TO PERSONAL COMPUTER WORLD

Let's face it, what can £12.50 a year buy you these days? Three or four visits to the cinema, a modest meal for two including a carafe of 'house' wine, two and a half albums from Virgin Records, a single ticket to the opera. Not a very impressive list is it?

On the other hand, £12.50 could guarantee that you will receive twelve issues of Britain's largest selling microcomputing magazine. If you are already a subscriber then send your £12.50 anyway, and we'll add another dozen issues to those you still have due on your current subscription.

As an added bonus to every person subscribing to *PCW* this month (whether a new subscription, a

1 Year Subscription (U.K. only)	£12.50	We send you 12 issues of PCW hot off the press direct to your door.
2 Year Subscription (U.K.only)	£21.50	You receive 24 issues saving yourself £3.50 off the full current subscription price. Plus you protect yourself against future increases in cover prices and postal rates which will save you £££'s over the period.
3 Year Subscription (U.K. only)	£32.50	You receive 36 issues saving yourself £5.00 off the full current subscription price. Plus you protect yourself against future increases in cover prices which will save you £££'s over the period.

renewal or an extension to your existing subscription), we will send you a voucher worth £2 off the cost of a PCW binder.

To qualify for this voucher you must use the subscription card stuffed inside this issue.

Send it today. It's true you can't eat it, watch it in the dark, drink it or smoke it, but we reckon if you're interested in microcomputing in any shape or form, £12.50 for 12 issues of *PCW* delivered to your office or home is excellent value.

Lastly, 'thank you' to all our existing subscribers and regular readers. The most recent figures from the Audit Bureau of Circulation shows that *PCW* is currently outselling its nearest rival by more than 12,000 copies. So we must be doing something right — but feel free to let us know if you think otherwise.

PLUS

We have now arranged for special 'first-off-the-press' copies to be mailed direct to subscribers which will ensure that they arrive either on the same day or one or two days in advance of national distribution in the IIK.

PLUS

Existing subscribers can take advantage of any of the offers above. Just tick the 'this is an extension subscription' box on the coupon and enclose your payment. The additional copies will be added to your existing subscription automatically. You do not have to wait until it is time to renew (by which time this offer will probably have been withdrawn). Save money by extending your subscription today!

PLUS

We have completely reorganised our Subscription Department and any problems, change of address, special requests etc etc will be promptly dealt with by an extremely 'user-friendly' human being should you need to write to us.

PLUS

We send subscription copies of PCW in a tough polythene wrapper. It will reach you promptly every month, unfolded and in good condition.

PILIS

You can pay for your subscription to PCW by cheque, postal order or by using Barclaycard (Visa)/American Express or Access. And you don't even need a stamp for your envelope. Use the coupon on the right.

Why do more people read PCW than any other microcomputer magazine in Europe?

A PSYCHOLOGICAL APPROACH?

It is to be hoped that such a model will embody all the enactive elements of the problem in a form that is easier to translate into totally abstract form.

Symbolic: the use of signs and symbols, previously defined to produce an abstract version of the problem. This characterises the symbolic level of confidence in problem solving.

Mathematics is typical of symbolic abstraction, and it is commonly recognised that difficulties associated with learning and understanding mathematics frequently stem from a lack of confidence in symbol manipulation.

In children these stages can be identified by the way that simple problems are tackled. Of equal importance is how the approach changes as a child gets older:-Given a dozen bricks a very young child, if asked how many he would get if he had to share his bricks with two other children, will resort to physically sharing the bricks. At a later stage he might solve such a problem by drawing three boxes and placing dots in them to represent bricks. He will be able to deduce from his iconic model that each child will receive four bricks. Later still, developing his confidence at the symbolic level will enable him to write $12 \div 3 =$ without hesitation.

'The way in which we approach a problem plays an important role in determining how successful or not our solution will be.'

In many situations these three levels of confidence occur simultaneously; they should not therefore be thought of as being physically distinct. The distinction to make is that the stages are conceptually different. We will often be able to look at particular lines of reasoning and identify areas that are causing problems as being symbolic as opposed to iconic or enactive.

This framework is equally recognisable in adult thinking, and the various levels of confidence can often be identified. An important point is that, when we have difficulties in tackling a problem, we frequently fall back to a lower level of problem representation in an attempt to achieve a better understanding.

Think how many times you have been presented with a mathematical problem to solve in which you plunged straight in with some symbolic argument only to find you got 'stuck' and rapidly resorted to a graph or diagram, that is, an iconic model, in order to get a better understanding of the problem itself.

These ideas produce some interesting generalities which have implications of particular benefit to us in our quest for better methods of designing and writing computer programs. It would appear, for instance, that most of us benefit by having an iconic model to fall back on while we are coming to grips with difficult or unusual problems. Some people are able to work at a symbolic level almost immediately. Such confidence is rare and those who can do this often have great difficulty in explaining to others how they arrived at a particular approach or why it was obvious to them but not to others.

So, there are two key points. Firstly, when you solve programming problems you are frequently solving other people's problems. You may very often need to explain your solutions and your lines of reasoning to others. There is a need to ensure proper communication of your ideas (often to nontechnical people). Secondly, the problems you examine will often be ill or imprecisely defined. Frequently, restrictions will be

the logical from the practical difficulties. In addition to this the diagrams provide an iconic level with which to examine a probblem. In an earlier article (*PCW* January 1983) you will have seen that it is easy to cope with changes even when you are in the middle of a solution. The very nature of the technique enables us to split a problem 'as we go' into easily handled sections while maintaining a coherence between these sections.

Next month I shall discuss the implications of regarding programming as a means of operating on 'sets' of data. This, and the concept of 'Normalisation' of a data set, provides a useful approach that enables us to avoid some of the pitfalls that have been found to cause many problems in real life applications.

The following references will be of use for people who would like to examine some of the published works related to the work of Jean Dominique Warnier:

Logical Construction of Systems by Jean Dominique Warnier. Pub. Van Nostrand Reinhold Company. ISBN 0-442-22556-3.

Logical Construction of Programs by Jean Dominique Warnier. 3rd edition trans. B M Flanagan. Pub. Van Nostrand Reinhold Company.

Practical LCP by Albert C Gardner. Pub. McGraw Hill Book Co (UK) Ltd. ISBN 0-07-084561-1. This is useful but Gardner's description tends to deviate from Warnier's in what appears to be an unnecessary way. The diagrammatic notation is not as clear as the original Warnier method. This disturbs the clarity of an otherwise good interpretation.

Structured Systems Development by Keneth T Orr. Pub. Youden Press New York. ISBN 0917072-06-5. A good non-theoretical introduction. Ken Orr's works are always very readable and he knows a lot about the practical uses of Warnier's work.

Structured Requirements Definition by Keneth T Orr. Pub. Ken Orr & Associates Inc, Topeka. Kansas. Again this is useful as an introduction. It contains many of the fundamental definitions that one comes across with the newer approaches to programming.

Personal Computer Word

* October 1981 issue contains a short introduction describing in simple terms some of the main advantages and some fundamental conventions that are used.

* April 1982 issue contains a Microsoft Basic implementation of a screen-form program. The use of the Warnier approach for program design is illustrated. This program was actually written as a 'halfway stage' before a full 8085 assembler version was prepared.

* January 1983 issue contains an 8085 assembly language program called DUMP. The complete design and implementation technique is given.

Byte Magazine. Various authors.

added to the problem while you are in the middle of finding a solution ie, the problem will change. During this time you will regularly come across quite severe difficulties. If you are working at a purely symbolic level you may conclude that some particular difficulty is insurmountable. Providing you have an 'iconic model' to fall back on you are more likely to come to terms with the new restraints.

The way, or ways, in which we describe a problem becomes important as we attempt to conceptualise and solve problems. It is also important because of the ease or difficulty with which we can convey our ideas and thoughts to others.

One of the techniques that capitalises on the above ideas is the 'Warnier diagram'. The power of using such diagrams to design programs is due in part to the separation of

Connect to professional printers with this Centronics interface.

ZX Lprint interface will enable your Spectrum computer (16 or 48K) to print on any dot matrix or daisywheel printer with 'Centronics' input (e.g. Seikosha, all Epsons, Star, Shinwa, Oki Microline and many others). Just plug ZX Lprint in and LPRINT and LLIST commands will work. And because NO additional software is needed all of your RAM is free to take professional word processing programmes such as Tasword 2.

High resolution screen dump can be done on many printers using optional 'COPY' software.

WORD PROCESSING

- HIGH RESOLUTION GRAPHICS PRINTING
 - SPREAD SHEET PRINTOUT
 - ADDRESS LABELS AND ENVELOPES

ORDER:	To EUROELECTRONICS, 26 Clarence Square,
	Cheltenham, Glos. GL50 2JP Tel: (0242) 582009

From: Name:

Address:

This order is for:

ZX LPRINT interface at £39.95

Interconnecting Cable at £11.95

COPY software at £5.00

Please specify make of your printer

Cheques/PO payable to EUROELECTRONICS please. Amount £. Please add £1.45 p&p.

(Quantity)

Barclaycard/Access

THE OSBORNE SPECIALISTS

For all things OSBORNE

NEW ERAC SOFTWARE

'CASHMASTER' - Analysed Cash Book &

Nominal Accounting system. Unique, easy-to-use, professionally approved for the

small business.

'ADMASTER' £52

Publicity & Advertising Text Display system for the Retail or Exhibition environment.

'CLUBMASTER' - The complete Golf Club system, now installed at 14 U.K. Golf Clubs.

All standard Osborne and other software available

ACCESSORIES:

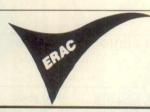

ERAC ADAPTOR for Multiple TV/Monitor Display PRINTER LEADS, KEYBOARD EXTENSIONS and TRAINING TEMPLATES at competitive prices

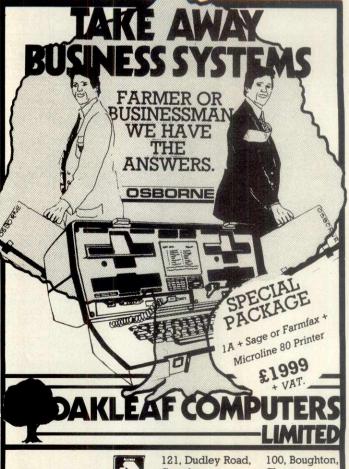

REPAIRS & MAINTENANCE:

Complete Osborne repair services

ACC NEWS

Rupert Steele presents his monthly round-up of news from the Amateur Computer Club.

The ACC club bulk mem bership scheme has been revised, in order to tailor it more accurately to the requirements of local clubs.

The members of ACC, who can take part in the election of the committee, come from two sources: direct members who have paid the subscription fee to ACC, (currently £5 or £2.50 for under 16s and OAPs), and club affiliate members, who belong as a result of their membership of a local computer club.

This is how you go about starting a bulk membership of your club. Get together the members of your club who require ACC membership, and send their names to me, with a fee calculated as follows:

Each of the first 50 members (minimum: 10 members): £3

Each of the next 50: £2.75

Each subsequent framember: £2.50

There are lots of things you can do with this scheme; perhaps your local club would like to beef up its regular news sheet by distributing ACCumulator as well (this is usually cheaper than producing a similar news sheet yourselves). Alternatively, ACC membership could be an optional part of your club subscription.

Clubs

I have had a letter from the Society of Genealogists, which is very interested in the application of computers in genealogy. So if your family tree is so complicated that you need a computer to unravel it, then you should contact David Hawgood of 26 Cloister Road, London W3 ODE who is setting up a genealogy club.

A chap called Chris

Wallwork tells of a 'Tonbridge Wells Area Computer Society', which meets twice per month, on the first and third Thursdays. Give him a ring on Tonbridge Wells 37682. If you can't get through, try Colin Turner on Ton Wells 21120.

Also around here is the SOBAT computer club, its aims, according to the Chairman, Mr T Kayani, are to provide an opportunity for micro owners to discuss their problems, exchange wants and exchange (publicdomain) software. It is also building up a growing library of games and educational programs for the use of its members. The club caters for East London, mainly Leyton, Ilford and East Ham. Contact: Mr T Kavani, Berridge House, Hillfield Road, London NW6 or phone (weekends) 01-556 5423.

Over to the west of town, Steve Ward of 28 Brodie Road, Enfield EN2 OEU writes to tell me of the 'Brigadier Computer Club'. This meets monthly on the first and third Monday from 7.30 to 10pm at the Brigadier Youth Centre, Brigadier Hill, Enfield. The subscription is £2, with a meeting fee of 25p. It is a general club, catering for novice and expert alike.

Mr Ken Ward of 45 Coleburn Road, Lakenham, Norwich NR1 2NZ writes to tell me of his proposed club in Norwich — he seems to be mainly Atari based, but if you have another system or interest, do contact him.

Dashing a few hundred furlongs to Newmarket, we meet 'Newbyte' — a catchy acronym. The secretary, John Smyth of 5 New River Green, Exning, Newmarket, Suffolk

CB8 7HS writes to tell me that it is a general club with a range of different machines. Most of the members are fairly new to micros, so there is no need to be intimidated — just race to the telephone and get John on Exning 8100.

Down on Canvey Island, I have had letters from two club contacts, namely Paul Sida of 3 Tewkes Road, Canvey Island, Essex and Dean Williams of 17 Mornington Road, Canvey Island, Essex SS8 8AT. The latter club is for any machine, although it has a minimum age of 14 for its members. As to whether these two clubs are actually the same, 'I'm sorry, I haven't a clue . . .'

Remaining in island vein, there is the Jersey Computer Association. The man to contact is Michael Murphy, PO Box 441, St Helier, Jersey, Channel Islands (I wonder what it's like to live in a PO box - pretty rough I imagine). You can also phone him in working hours on (0534) 78399. Anyway, the Jersey Computer Association is a general group with many machine interests, including both business and home applications. The subscription varies from £2 to £16 depending on who you are.

Meanwhile, up in sunny Merseyside, we have the Liverpool BBC and Atom Group, which now meets twice monthly; on the first Thursday of the month at the Old Swan Technical College (Rm C33) and on the third Thursday at Birkenhead College. For more info, contact Nik Kelly on 051-525 2934.

Also in the Liverpool area, a Mr Gary Metcalfe of 24 Marlston Avenue, Irby, Wirral, Merseyside L61 3XU writes to tell me of his new computer club. This will be a general club, including Atari, VIC, Commodore 64, BBC, Spectrum and Dragon users — with more on the way.

Going east I find Ian White, who tells me of the South Trafford Microcomputer Club (South Manchester). This group has been running for almost two years and meets once a fortnight. The members possess a wide range of micros, and they publish a monthly newsletter, including teaching material in Basic and machine code. Contact Ian on 061-969 2080 or write to him at 16 Leicester Avenue, Timperley, Altrincham WA15 6HR.

Further east still, I find James Bridson of Barnsley Co-Operative Computer Club, 39 Keresforth Hall Road, Kingstone, Barnsley, S Yorks S70 6NF. It holds its meetings on co-op premises which are provided free (hence the name of the club). So if you're clubless of Barnsley, you know who to talk to.

And finally, a Mr Illegible writes from Italy to tell me of its ZX users club. It calls itself Sinclair Club, and its address is: c/o Arrigo Bomdi, via Molino Vecchio 10/F, 40026 Imola, Italy. So if you want to brush up your Italian, while learning about the fantastico ZX81, then you know what to do.

* For more information on the ACC, Club Spot 800, or any of the points mentioned above, contact: Rupert Steele, St John's College, Oxford OX1 3JP or phone (0865) 512811. Please note that this address and phone number will be changing shortly.

NEWCOMERS START HERE

This is our unique quick-reference guide, reprinted every month to help our readers pick their way through the most important pieces of (necessary) jargon found in PCW. While it's in no way totally comprehensive, we trust you'll find it a useful introduction.

Happy microcomputing!

Welcome to the confusing world of the microcomputer. First of all, don't be fooled; there's nothing complicated about this business, it's just that we're surrounded by an immense amount of necessary jargon. Imagine if we had to continually say 'numbering system with a radix of 16 in which the letters A to F represent the values ten to 15' when instead we can simply say 'hex'. No doubt soon many of the words and phrases we are about to explain will eventually fall into common English usage. Until that time, PCW will be publishing this guide — every month.

We'll start by considering the microcomputer's functions and then examine the physical components necessary to implement these functions.

The microcomputer is capable of receiving information, processing it, storing the results or sending them elsewhere. All this information is called data and it comprises numbers, letters and special symbols which can be read by humans. Although the data is accepted and output by the computer in 'human' form, inside it's a different story - it must be held in the form of an electronic code. This code is called binary. Binary is a system of numbering which uses base 2 instead of the more familiar decimal - or, to be more accurate, denary-system of base 10. In binary notation there are only two digits - 0 and 1 - which the computer recognises as the absence or presence of an electric current. The easiest way to visualise this is to think of each binary digit (bit) as being a switch which can be either off or on. Each binary digit stands for a power of 2. The right-most digit, the least significant, is 2^0 =1, the next 2^1 =2, then 2^2 =4, 2^3 =8, 2^4 =16, 2^5 =32, 2^6 =64, $2^7 = 128$, $2^8 = 256$. So decimal 24, for example, is represented in binary as 00011000. A set of eight bits is known as a byte and, to make things easier for humans, a third system of numbering, hexadecimal or hex for short, is used as a sort of 'halfway house' between binary and denary. Hex uses numbers to base 16, with denary numbers between 9 and 16 represented by the letters A-F. The hex equivalent of a byte is obtained by giving each half a single character code: 0=0000, 1=0001, 2=0010, 3=0011, 4=0100, 5=0101 E=1110 and F=111. Our example of 24 is therefore 18

To simplify communication between computers, several standard coding systems exist, the most common being ASCII (American Standard Code for Information Interchange). This allocates a numerical code to each digit and letter. For example, the number 5 is given the ASCII code 35 hex, 53 decimal, whereas a capital A is represented by ASCII 41 hex, 65 decimal.

The computer processes data by reshuffling, performing arithmetic on, or by comparing it with other data. It's the latter function that gives a computer its apparent intelligence'— the ability to make decisions and to act upon them. It has to be given a set of rules in order to do this and, once again, these rules are stored in memory as bytes. The rules are called programs and while they can be input in binary or hex (machine code programing), the usual method is to have a special program which translates English or near-English into machine

nearer the **programming language** is to English, the faster the programming time. On the other hand, program execution speed tends to be slower.

The most common microcomputer language is Basic. Program instructions are typed in at the keyboard, to be coded and stored in the computer's memory. To run such a program the computer uses an interpreter, which is usually built into the machine's ROM (see later paragraph on this page). The interpreter picks up each Basic instruction, translates it into machine code and then feeds it to the processor for execution. It has to do this each time the same instruction has to be executed. A much faster method is to use a compiler, which accepts each instruction in turn, waits until the program has been entered, then turns each instruction into machine code before running the program. This means that each instruction has to be translated once only consequently the speed of execution is considerably improved.

Two strange words you will hear in connection with Basic are **PEEK** and **POKE**. They give the programmer access to the memory of the machine. It's possible to read (PEEK) the contents of a byte in the computer and to modify a byte (POKE).

Moving on to hardware, this means the physical components of a computer system as opposed to software — the programs needed to make the system work

At the heart of a microcomputer system is the central processing unit (CPU), a single microprocessor chip with supporting devices such as buffers, which 'amplify' the CPU's signals for use by other components in the system. The packaged chips are either soldered directly to a printed circuit board (PCB) or are mounted in sockets.

In some microcomputers, the entire system is mounted on a single, large PCB; in others a bus system is used, comprising a long PCB holding a number of interconnected sockets. Plugged into these are several smaller PCBs, each with a specific function — for instance, one card would hold the CPU and its support chips. The most widely-used bus system is called the \$100.

The CPU needs memory in which to keep programs and data. Microcomputers generally have two types of memory, RAM (Random Access Memory) and ROM (Read Only Memory). The CPU can read information stored in RAM - and also put information into RAM. Two types of RAM exist - static and dynamic; all you really need know is that dynamic RAM uses less power and is less expensive than static, but it requires additional, complex, circuitry to make it work. Both types of RAM lose their contents when power is switched off, whereas ROM retains its contents permanently. Not surprisingly, manufacturers often store interpreters and the like in ROM. The CPU can only read the ROM's contents and cannot alter them in any way. You can buy special ROMs called PROMs (Programmable ROMs) and EPROMs (Erasable PROMs) which can be programmed using a special device; EPROMs can be erased using ultra-violet

Because RAM loses its contents when power is switched off, cassettes and floppy disks are used to save programs and data for later use. Audio-type tape

audio tones and recording them; later the computer can listen to these same tones and re-convert them into data. Various methods are used for this, so a cassette recorded by one make of computer won't necessarily work on another make. It takes a long time to record and play back information and it's difficult to locate one specific item among a whole mass of information on a cassette; therefore, to overcome these problems, floppy disks are used on more sophisticated systems.

A floppy disk is made of thin plastic, coated with a magnetic recording surface rather like that used on tape. The disk, in its protective envelope, is placed in a disk drive which rotates it and moves a read/write head across the disk's surface. The disk is divided into concentric rings called tracks, each of which is in turn subdivided into sectors. Using a program called a disk operating system, the computer keeps track of exactly where information is on the disk and it can get to any item of data by moving the head to the appropriate track and then waiting for the right sector to come round. Two methods are used to tell the computer where on a track each sector starts: soft sectoring where special signals are recorded on the surface, and hard sectoring where holes are punched through the disk around the central hole, one per sector.

Half-way between cassettes and disks is the stringy floppy — a miniature continuous loop tape cartridge, faster than a cassette but cheaper than a disk system. Hard disk systems are also available for microcomputers; they store more information than floppy disks, are more reliable and information can be transferred to and from them much more quickly.

You, the user, must be able to communicate with the computer and the generally accepted minimum for this is the visual display unit (VDU), which looks like a TV screen with a typewriter-style keyboard; sometimes these are built into the system, sometimes they're separate. If you want a written record (hard copy) of the computer's output, you'll need a printer.

The computer can send out and receive information in two forms — parallel and serial. Parallel input/ output (I/O) requires a series of wires to connect the computer to another device, such as a printer, and it sends out data a byte at a time, with a separate wire carrying each bit. Serial I/O involves sending data one bit at a time along a single piece of wire, with extra bits added to tell the receiving device when a byte is about to start and when it has finished. The speed that data is transmitted is referred to as the baud rate and, very roughly, the baud rate divided by ten equals the number of bytes being sent per second.

The ensure that both receiver and transmitter link up without any electrical horrors, standards exist for serial interfaces; the most common is RS232 (or V24) while, for parallel interfaces to printers, the Centronies standard is popular.

Finally, a modem connects a computer, via a serial interface, to the telephone system, allowing two computers with modems to exchange information. A modem must be wired into the telephone system and you need British Telecom's permission; instead you could use an acoustic coupler, which has two obscene-looking rubber cups into which the handset fits, and which has no electrical connection with the phone system — British Telecom isn't so uppity about the use of

INNOVATIVE TRS 80-GENIE SOFTWARE

from the professionals

£250 REWARD

Below you will find described a new program entitled Enigma. It is a true simulation of the German wartime cypher machine of that name. It will encipher messages which may be communicated to third parties by any means who, assuming they have the key, will be able to use their Enigma program to decipher.

We will pay the sum of £250 to anyone [who has purchased the program] who can demonstrate an infallible method of deciphering the coded message supplied in the program's instructions. We consider Enigma to be the best program of its kind on the U.K. or U.S. market; contestants may therefore use any orthodox means to crack the code, including microcomputer programs other than Enigma.

The original message and keys will be lodged with our Solicitors for safe keeping in a sealed envelope. In the [hopefully] unlikely event that the code is cracked by more than one person, the reward will be paid to the first customer who demonstrates to us that he has succeeded.

MOLIMERX LTD.

During the 1939/45 war the German Army and Intelligence used a deciphering machine called Enigma. It was a fascinating machine and the stories that have surrounded it are equally interesting. There have been some four or five books written about the machine, and with regard to the way in which the British counter intelligence managed to crack the code.

That they did so was the culmination of some fortuitous circumstances, a lot of luck, but mainly it was due to the fact that the people who did it were extremely clever mathematicians. The fact that it took so much brain power, plus a rudimentary type of computer and a specimen of the machine in order to crack the code is an indication of how complex that code is.

The Enigma microcomputer program that we are selling is a simulation of the original machine, together with one or two improvements which were suggested by Gordon Welchman, who wrote the book "The Hut Six Story" last year and was also the leader of the team that cracked the code.

Although the machine and, therefore, the program is so complicated, its use is amazingly simple. One simply inputs a key and a message and the code is supplied. To decipher, the message is input again with the key and if the key is correct then the decoded message is displayed. With the cassette version it is necessary to input from the keyboard but with disks both inputs and outputs may be to disk files if required. A printer is of course supported.

The code may be transmitted in any way which the written word can be transmitted. Companies who wish to fully protect their communications will no doubt have the program generate the code and then tap it into a telex. Tape users will have to send either the output from their printer or write down the code direct from the screen.

Enigma is a fascinating program designed, not only for those people who are interested in encryption professionally or as a hobby, but also for companies or private persons who wish to communicate with others in an entirely secure manner. As is shown by the above Reward Notice, we have great faith in the powers of this piece of software.

Dept. PCW, 50 High Street, Edgware, Middlesex, HA8 7EP. Tel: 01-951 1848

PROGRAMS

PCW is interested in programs written in any of the major programming languages for all home and small business micros. When submitting programs to PCW please include the following:-(a) A cassette or disk of the program

(b) A listing on plain, white paper (typewritten if no printer available).

(c) Comprehensive but brief documentation. (d) A suitable sae if your would like your materials to be returned after use.

Please mark (a), (b) and (c) with your name, address, program title, machine (state minimum RAM where appropriate) and — if possible — a daytime phone number. All programs must, please, be fully debugged. Programs are paid for at the rate of £40 per page of published listing, plus a £100 bonus for the Program of the Month. Send contributions to: Surya, PCW Programs, 62 Oxford Street, London W1A 2HG.

I'll do my best to acknowledge receipt of programs as quickly as possible, but following this acknowledgement it will usually be some time before a decision can be made, so please be patient! Generally speaking, programs which are rejected for any reason are returned fairly quickly, so 'no news . . .

Note: Due to industrial action at Rathbone Place Sorting Office, London, W1, programs — along with all our other mail — are subject to delay.

Oric 1 owners will, by now, be tearing out their hair and banging their heads against the nearest wall . . . the corrections to the corrections to the errors in the 'Bug Eater' listing are included in this month's 'Bludners'. This program will now work (he says confidently). Could A Roe, author of 'BBC Balloons', please give me a ring — I've lost your address. And lastly, authors will be pleased to note that the new Programs rate is £40 per page with a £100 bonus for the author of Program of the Month. And now to this month's contributions ...

BBC TV Test

For someone with the necessary techni cal knowhow, TV Test should provide all the information needed to set up a tv or monitor correctly. The program makes use of the BBC's high-resolution graphics to simulate a pattern generator, offering a crosshatch, dot pattern, colour bar, colour matrix, focus grid and test card. I don't know enough about pattern generators to comment on the quality, but our referee (a lecturer in physics who presumably does know about pattern generators) seemed suitably impressed. You'd be hard-pressed to find a pattern generator selling at much below the price of a BBC Model A - besides, you can't play PAC-MAN on a pattern generator. The program runs on either model, and is menu-driven. Pressing the space bar returns you to the menu.

Atom Four-stroke Cycle

by Jonathan Empson

'Four-stroke Cycle' is a simple graphical demonstration of the workings of a fourstroke internal combustion engine. The program, intended for use as a visual aid in a physics or general science lesson, shows the movement of the piston

together with the operation of the inlet and exhaust valves. The display freezes after each cycle and waits for a key press before continuing. This program requires the Ross utility ROM.

PET DISK REVEALED!

That's right - with SUPERSOFT'S new DISK REVEALED program, you can examine any track or sector on your PET disk's - even if the disk gives read errors! Whether you use DISK REVEALED to recover lost data, create protection systems, or in an attempt crack security on the **DISK** REVEALED disk, you'll find it excellent value at £25 plus

4 OWNERS - A version for the 1541 drive is on the way

In the many pages of **SUPERSOFT'S** winter '82 catalogue (no we don't have a new one yet, but then it still seems like winter '82), you'll find innovative **PET** products like **MATRIX**

BASIC (£75) and INFINITE ARITHMATICALLY minded. There's BACKGROUND music (£18), for the musically minded, and the bloody minded, a whole range of adventure games that will tax your persistence and test your sanity. For only £8 you can choose from a large range of arcade games including CRAZY KONG, SUPER GLOOPER,

MANGROVE, or two games for the price of one, CLOUDHOP and BREAKOUT. Spend a little more (£10) and you can buy SCRAMBLE – it's ace!

We reckon that only 25% of PET owners in the UK are on our mailing list. Come on the rest of you let's have your name and address pronto. Though more and more of our advertising is med at 64 owners we're not going to discontinue our 300 PET programs, accessories and peripherals.

Genie SLC-2

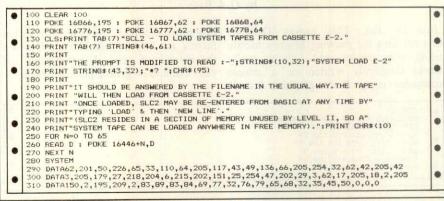

by E F Grimes

The Video Genie's ability to load from and save to an external cassette-player is primarily intended for file-handling, but can also come in useful when a cassette refuses to load from the built-in unit. There is, however, no facility for loading SYSTEM tapes from an external cassette-player, hence this routine.

Once entered into the computer, the routine is available to the user even after typing new since it is stored above user-RAM. To load a SYSTEM tape from an

external cassette-unit, type 'LOAD'. This will give you a modified system prompt, namely 'SYSTEM LOAD -2__'. The filename is now entered in the usual way.

SLC-2 is stored in the communications area of RAM normally used by the disk operating system. This means that the routine is incompatible with disk-based Genies, but since it is specifically designed to overcome cassette loading problems, this is of no consequence.

MZ-80k Forth Interpreter

by J C Lea

This Sharp MZ-80k program requires DATA statement in the Basic program. 'Basic Extensions' or a similar extended Basic supporting full string comparisons: it will not run uder the Basic SP-5025 supplied with the machine (cf PCW, DEF SOUARE DUP *: March 83, pp 178-181).

The program is a simple Forth VARIABLE SHARP 'pseudo-interpreter' written in Basic. 8 SHARP! Although slow and somewhat limited, the interpreter does provide an effective SHARP @ CUBE. introduction to the language. The follow- 20 1 DO DUP . LOOP keywords and functions supported:

+,-,*,/

>,>=,=,<>,<,=< (operators) DUP, SWAP, OVER, ROT, DROP, (stack manipulators) DEF, VARIABLE, !, @,

FORGET (assignment) IF-ELSE-ENDIF, DO-LOOP,

REPEAT-UNTIL, BEGIN-WHILE-AGAIN (control structures) CLEAR, INPUT, PEEK, POKE, RAND, LIST, EXAM (general)

LIST is used to display dictionary entries - either a single named entry or, in default, the whole dictionary. EXAM lists the values of the stack. Note that 'DEF' is used in place of ':' since we cannot include a colon as part of a

Once you've typed in the interpreter, try the following simple Forth program:

4 SQUARE.

DEF CUBE DUP SQUARE * ;

are FORGET CUBE

5 CUBE

DEF DEC SHARP @ 1 - SHARP!:

REPEAT SHARP @ . DEC SHARP @ 1 UNTIL

BEGIN 10 RAND DUP . 5 WHILE . 'TESTING' CR AGAIN

'Forth Interpreter' doesn't in any way set out to teach Forth, so you'll need some kind of introductory text if you're new to the language. There are plenty of books around, and your local computer shop and/or library should be able to help. The program does allow you to gain hands-on experience of the language to enable you to judge whether it's to your taste before spending your hardearned cash on a fully-fledged interpreter.

A BASIC COURSE FOR EVERYONE Carrbridge Hotel, Inverness-shire

SPEYSIDE SYSTEMS, CARRBRIDGE

We are holding 5-day Residential Courses in the heart of Speyside, 6 miles from Aviemore. The course includes your own use of a new microcomputer with excellent tuition booklets and on-hand instruction. The course is designed for those involved in micros for personal and business use. As well as the intensive BASIC course you will have full board and lodging. Arrangements can be made to stay over the weekend and allow extra use of the computer. Numbers are restricted to six.

5 DAY COURSE plus food and board £250

Tuition undertaken by experienced personnel. Dates are 18th to 22nd July and Sept 26th to 30th.

Further dates can be arranged on demand, also weekend residential courses. Please send for our brochure. Details:

Mrs. Linda Anderson M.A., Speyside Systems Carrbridge, Inverness-shire. Phone Carrbridge 689.

PRINTERS FOR SHARPS

Most dot matrix and daisy wheel printers available for MZ80K & MZ80A.

Our package includes printer, cable, interface and software. Centronics for RS232, automatic conversion of Sharp codes to standard ASCII. All printer control codes can be used with BASIC. Other boards available include EPROM memory storage and programmers, ADC's etc. Details from:-

PROGRAMS

★★ Program of the month ★★ TRS-80/Video Genie Domain of the Djinn

by David Marsh

'Domain of the Djinn' is a well-written and thoroughly absorbing adventure game for a Video Genie/TRS.80 with at least 12k RAM.

trolls, ogres, dragons and other dodgy types who make it their business to lurk in dark corners—doing whatever it is mythical monsters do in dark corners.

The Domain is a six-storey building, each floor consisting of a maze of rooms and passages. Along with either one or two friends, your task is (surprise, surprise!) to find the treasure hidden in one of these rooms. To do this, you and your team wander through the Domain picking up the odd artefact along the way and generally being nosey.

The Domain, naturally enough, is inhabited by an assortment of zombies,

trolls, ogres, dragons and other dodgy types who make it their business to lurk in dark corners — doing whatever it is mythical monsters do in dark corners. On meeting one or more of the Domain's tenants, you have a number of options; including striking up a friendly conversation, and, very sensibly, getting the hell out of it! For braver souls, you also have the option to pick a fight in order to claim the contents of the room, but I should warn you that some of the occupants have distinctly violent tendencies. Also, you shouldn't be too surprised if the room turns out to be empty after

M & J SOFTWARE

DRAGON COMPANION BOOK

If you are bored with games and Basic and want to learn more about your machine, this is the book for you. Includes disassembler listing and many useful routines.

DRAGON fig-FORTH

E10
FORTH ASSEMBLY LISTINGS

6502, 8080, 280, 6809, 6800, 9900, 8086/8088, 68000, PDP-11, 1802. These are standard fig-FORTH assembly listings.

INSTALLATION MANUAL

E53

Necessary for implementing FORTH and its editor.

6502 MACRO ASSEMBLER

This program is written in fig-FORTH and is a structured one-pass assembler. It will work on any fig-FORTH implementation with only one alteration. Control structures include: BEGIN, END, AGAIN, IF, THEN, ELSE, ENDIF, REPEAT, UNTIL, WHILE.

SHARP MZ 80A CASH FLOW & MODELLING

Do you have problems controlling your cash flow? Then you need this menu driven program

FACILITIES INCLUDE:

Setting up historic data · Monthly input of data Examinining/amending data · Displaying data Modelling data · Reading/saving data Year end routine (36 periods)

Available now for the Sharp MX 80A £12.00 including documentation, p&p.

MICROMART

CHESTER COMPUTER SCHOOL

Modular training courses for office personnel: Managers
Technicians
Professionals of all kinds

Learn to program in
Dbase II
Stock Systems
Accounting Systems
Payroll
Management Information
Systems
Learn Systems, Thinking and
analysis
and much more.

One, two and three day courses. Three week executive courses include group project and practical work experience.

Students can also correspond to increase their skills to a commercial level.

All students receive course certificates. Fees from £20 per day. Details and application forms from:

The Principal Chester Computer School 7 Stanley Place Chester Tel: 0244 318959

DEPARTMENT OF EXTRA-MURAL STUDIES

University College of Wales 9 Marine Terrace, Aberystwyth

THE MICROCOMPUTER REVIEWED

A course aimed at a more practical understanding of Microcomputers

19-23 Sept. '83 · Aberystwyth

Further details from above address (Tel. 617616)

New-Brain

EDITOR adds extra commands to the machine CHANGE, FIND, GET, INSERT, DELETE, MOVE, VALUE, ORGANISE, CENTRE & RIGHT JUSTIFY TEXT.

Can be used as a word processor database or program editor, handling up to 24k on a 32k machine. The files created are in ASC11 format.

RENUMBER can be used independently or in conjunction with EDITOR. All or part of a program may be renumbered with update of GOTO/GOSUB/THEN/RESUME statements.

MONITOR produces machine code programs on tape. Input, display, record, & test code hard copy feature. Input/output is in HEX or ASC codes.

PET HI-RES!

£149 plus VAT brings you 320 by 200 dot resolution on your PET/CBM screen No soldering is necessary - SUPERSOFT graphics boards just plug in!

Three models are available: for 80-column machines specify the HR80 board, large screen 40 column machines need the HR40B board; for other machines (except very early PETs with no Rom sockets) order the HR40b board. All thoards add 8k of RAM and include GRAPHIX machine code utility software i EPROM. Over 500 boards have been installed in the UK — by schools, colleges hospitals, research establishments, even home users — and hundreds more are being exported worldwide.

SUPERSOFT are Commodore specialists. We have a large range of software, accessories, and supplies for existing COMMODORE machines and will be supting new machines as they are slaunched. Our 20 page catalogue is free to own and users of PET/CBM machines — but here's a selection of products to whet your appetited Add 15% VAT to all prices.

BUSICAL C (FINANCIAL SPREADSHEET) PAPERMATE PLUS (WORD PROCESSOR) ..

USED COMPUTER EOUIPMENT

Register your need to buy or sell with us - we will provide up to five contacts.

BUYERS — free service! SELLERS — we charge only £20 + 1% declared value

PROGRAMS

you've gone your ten rounds with a hungry goblin.

Movement through the maze is by use of the N, S, E and W keys to represent the four points of the compass. When you come across some stairs, you can go either up (U) or down (D) (logical enough). It should be noted, however, that things can get distinctly hairy down in the lower regions.

Your chances of coming out of a confrontation with an irate centaur - with the same number of limbs as when you entered the room - depend on the relative strengths of your team and that of your opponent. These strengths are measured in terms of four factors: survival, battle, magic and communication. Initially, you have to choose your team to obtain what you feel to be the optimum combination of these factors. During your journey, the more fights you win, the more monster-types you manage to convert to your noble cause (getting rich quick), and the greater the area of the maze you manage to explore, the greater your party's strength.

Survival is a measure of fighting power. Running out of survival points is not recommended since your life runs out with them. Battle points are a measure of your fighting skills - the more points you have, the less likely your opponents are to see your body as a convenient place to stick their swords. Communication points measure your ability to sweettalk yourself out of tricky situations ('there, there, nice dragon' - that sort of thing). Magic points measure, well, magic.

Game points are awarded for various the acquisition of gold, reasons:

platinum, jewels, artefacts and killing the Djinn who, incidentally, are neither poor nor defenceless - so don't waste any sympathy on them! The artefacts referred to include such things as Rhombs handy-sized hyperspace units enabling you to jump from one place to another instantly.

However, they only work on the level you're on.

In dire emergency, you can effect a hasty exit by pressing the panic button. Since this key is noticeably lacking on the TRS-80 keyboard, SHIFTed E has to serve. This does get you out of whatever mess you've got yourself into, but at a price: you lose all your treasure to a hyperspace junkyard. You're also liable to end up just about anywhere and you can't rely on this feature too often.

Before you begin your epic voyage into the unknown, take a bit of time to choose your team carefully. Magicians rate highly on communication and magic, but they don't make particularly good 'minders'; fighters are good in battle but have the IO of educationally sub-normal carrots. Our referee also recommends staying well clear of the lower levels until you have some strong fighters on your

In case all this sounds complicated, it is. It's not the sort of game you can master in ten minutes and wonder what to do next. The menus and input prompts are all quite straightforward, though, so you shouldn't have any problems running it. All in all, an addictive game - I'd certainly like to see more programs of this standard being submitted to PCW Programs. Now you're not going to take a challenge like that lying down, are you?

ACCOUNTING PROGRAMS

SPECTRUM

- FROM KEMP LTD -

Before you buy an Apple or a PET try one of our accounting programs. Our programs mean that you can now run sophisticated ledger accounting systems on your Spectrum, similar to those running on £500 micros and sometimes costing hundreds of pounds.

Program design means that each program can cope with up to 14,000 transactions a year (assuming you account on a monthly basis). Each menu driven program is easy to use and is extremely comprehensive. Our sales ledger program, for instance, provides sales summaries (VAT, receipts etc.), prints monthly accounts and statements and allows you to set credit limits. Full audit trail is provided. Excellently documented, each program comes with its own 20 page manual.

Our quality programs are also useful for educational and demonstration purposes.

48k Stock Accounting/Control ... £10.95 48k Sales Ledger ... £10.95 Both for ... £18.95

Dealer enquiries welcome

BBC Cross-hair Cursor

by David Ingram

BBC graphics enthusiasts should find the fellowing procedures a useful, if simple, addition to their library of subroutines. Both routines use a joystick to move a cross-hair cursor and will work with either BBC machine.

The first listing moves the cursor around the screen without adding anything to the display, while the second

allows the user to 'mark' points on the screen using the joystick button which the program then joins with a straight

Although intended for use with joysticks, the routines should be fairly straightforward to adapt for keyboard

```

32K BBC users,

Can you make back up copies of all your software? Can you copy any program that you would like to buy but it is too expensive?

Can you copy any machine code program or data

If the answer is no then you need the Protonsoft Master Copy program. This is the program that the serious software collector can't be without.

Also still available is our excellent Star Trek game. Full colour high resolution graphics and excellent sound effects make this game the best of its type available. We can assure you that you won't be disappointed. Both programs available separately on high quality computer cassette with full documentation for £5.55 inc P&P.

Cheques to Mark Smith Send to

PROGRAMS

Apple II Menucreate

by Jim Hawkins

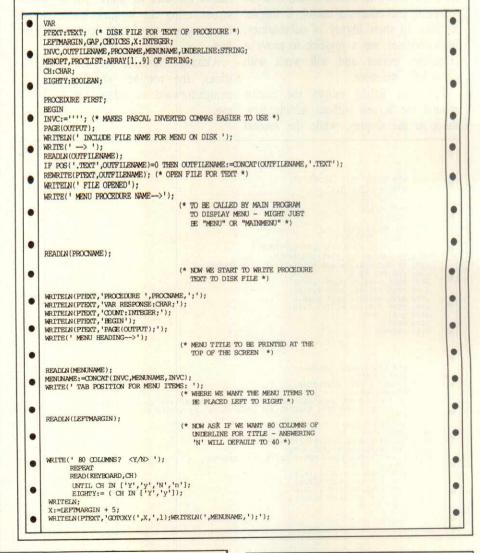

'Apple II Menucreate' is a utility routine designed to generate menu procedures in Pascal. The program was written in Apple/UCSD Pascal but should adapt easily to other implementations.

The program requests details of the items to be included in the menu and the desired layout, before generating a text file of the appropriate Pascal procedure. This text file may be either 'Copied' straight into a program or simply called by the compiler as an 'Include' file. The resultant procedure checks for a valid response, sounding the bell in case of invalid input. It should be noted, however, that the program does not generate error messages. The example menus require some dummy procedures;

the procedure 'Testbed' (see listing below) is used to generate these.

The menu procedure can be given any name and uses no global variables so that an unlimited number of menus can be called. The program will also, if required, produce the text of a dummy program in order to show the menu as it will appear on the screen. Care must be taken when entering the listing to get all the commas and inverted commas correct, otherwise a stream of 'STRING CONSTANT MUST NOT EXCEED ...' messages will be produced.

Besides being a useful and neatlywritten Pascal program, 'Menucreate' also serves to illustrate the way in which program generators work.

JOYSTICKS from £4.50 each DIRECT FROM OUR FACTORY

IN KIT FORM: kit contains 1 switched joystick assembly. 2 moulded case halves, fire button .1.5 metres 5 core + screen cable, fixing screws £4.50 per KIT

READY BUILT with 9 way "D" socket - suit Atari or Vic 20 FEW ONLY with potentiometers and 5 way din socket to suit Dragon £5.00 each

CONNECTORS

'D' connectors 9 way female plug or 15 way male plug complete with hoods

Din plug 5 way 240 deg.

NEWBRAIN RENUMBER

A resident machine code program which renumbers all or part of BASIC programs. Allows moving of lines from one region to another. Lists new line-number and new references (with type), to screen or printer. Lists and originally modifies references to non-existent lines. Helps keep your programs tidy

£15.00 inc. P&P. for tape and user guide. Contact

Oric 1 Word Scrambler Conversion

by Ian Collins

You may remember the TRS-80 Word Scrambler program published in the April issue (pp 229-230). Ian Collins has written in to say that only two lines need to be modified in order for the program

to run on an Oric. These are:-10 CLS: CLEAR: DIM P\$(999): M=1: 200 R = INT(RND(1)*L+1)

.

BBC Quadsolve

by I Kingston

Quadsolve' is a neat and straightforward program for solving quadratic equations.

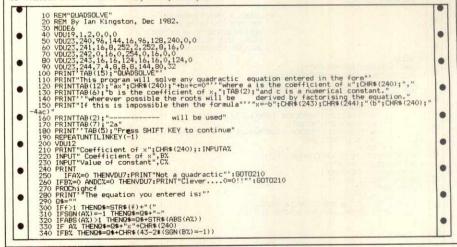

The user enters the values of a, b and c in the equation $ax^2+bx+c=0$. The program attempts to solve the problem first, by factorising, and then — if this is not possible — by using the quadratics formula. Since each line of the working is displayed along with the final solution, the program makes a useful teaching aid as well as being ideal for doing your maths homework!

When entering the program, note that the ASCII character 'i' should be entered as '[' when typing in the listing: the lines to watch out for are 420, 540, 630, 770

and 820. Line 40 selects green as the text colour. Unless you have a monitor (as opposed to a tv set), this can look distinctly nauseating, so you may like to experiment with other colours (like white, perhaps?).

User-defined characters are used to provide the correct mathematical notation for square, square root, divided by, plus-or-minus and factorises to. For this reason, mode 6 is used rather than the usual mode 7 since the latter has no facility for non-standard characters.

The program requires a model B and was tested under the 1.2 OS.

```

Newbrain GENIN

by S E H Fellowes

GENIN is an acronym for 'general input' routine and is intended to be used as a subroutine in programs where a significant amount of input is required. The routine is designed to be completely crashproof (I said 'designed to be' — there are no prizes), rejecting invalid input while allowing the use of insert, delete and left and right cursor movement.

The routine checks that string length is less than or equal to the value of 1, and that each character within the string is within the ASCII range defined by ils; these values to be set by the programmer earlier in the program. To accept only four letter

words, for example, 1 should be set to 4 and il\$ set to 'az'. In the listing given below, a sample calling routine is given in lines 10 and 20.

A carriage return returns the string without trailing spaces and CONTROL/ CR pads the string with spaces to the string length set by 1. The input is returned as in\$. If you are dealing in numeric input, then add one further line: 925 in=val(in\$)

To date, this is the one and only New-Brain program I've received: Newbrain programmers, where are you? Haven't you noticed our new rates?

DISKOGRAPHY

A BRIEF GUIDE TO FLOPPY DISKS

continued from page 162

purchasing. This is the number of tracks on the disk, ie, the number of concentric rings on the disk on which data may be recorded. On eight inch disks there are always 77 tracks but for five and a quarter inch disks, there is a choice of 35, 40 or 80 tracks. Both 35 and 40 track disks are recorded at 48 tracks per inch ('TPI') but 35 track recording uses less of the disk surface to write to than 40 track recording. Therefore, a 40 track disk can be used on a 35 track drive but not the other way round, 80 track disks are recorded at 98 TPI (half the distance between tracks) and, although 80 track disks are sold, I have never had any problems reformatting double-density 40 track disks for use on an 80 track drive. Of course, 80 track disks can be reformatted as 40 track or 35 track disks if required.

.

That completes this summary of the physical differences between the various floppy disks on the market. Of course, data can be written to disks, even physically identical disks, in many different formats but that is another story.

EPSON QX-10

continued from page 172

that all the important Basic commands are available at a single stroke. To display characters in a particular font, you'd use the command PRINT " the machine's normal font and then select the new font by pressing the SF keys in the appropriate combination. You then type the words in the selected font, and go back to the standard font for the rest of the program line. SAVEing the program, LOADing it again and LISTing it reveals that the fancy font parts are always retained in their proper format when you LKIST the program, there they are, in their special fonts, just as you typed them in.

Provided you have the correct type of Epson printer, you can also produce these fonts on paper - see the listing and printout in Checkout. This is done automatically from MFBasic using the printer's bit image graphics facility and very nice it looks, too. It's certainly a fun way to liven up otherwise boring documents like invoices and grovelling letters to the bank manager.

MFBasic also provides good graphics capabilities to take advantage of the machine's excellent 640 x 400 display. A perusal of the demonstration program listing revealed that it is all easy and straightforward and programmers should have no difficulty in producing some very impressive business graphics packages with this Basic.

The benchmark timings show MF Basic

£5 each from

to be respectably quick, putting the machine well into the upper third of our rankings table (see *PCW* November 1982).

Expansion and potential

The five expansion slots inside the machine indicate that a variety of interesting extras should be on their way and indeed they will be here shortly, most of them. These will include an IEEE-488 interface, an extra RS232 board, joysticks, a light pen, an acoustic coupler and a prototyping board. Local area networking capabilities will be catered for with an Omninet interface while for high-speed communications a fibre optic interface will also be available. At the time of writing, availability dates and prices had not been fixed by Epson (UK) for any of these.

The extra memory expansion will take the form of chips to plug into the spare sockets; it is expected that many customers will buy the machine already configured with the full 256k RAM but that dealers will be able to upgrade 192k machines for about £50 or so.

A colour display system, with the same 640 x 400 resolution as the monochrome display, is currently being evaluated by Epson (UK) and sounds very nice indeed. Again, availability and pricing had not been decided by the time this went to press and Epson was uncertain whether it would be offered as an upgrade to existing machines or in the form of a colour QX-10.

My single criticism of the machine concerns its disk capacity, although maybe, as a Sirius owner, I am a little spoilt in this respect. In any case, a hard disk option is a probability but there are no further details on this at the moment.

Documentation

The review machine came with a thick, just-smaller-than-A4, spiral bound QX-10 Operations Manual. This is properly typeset and well laid out, with an index, and covers a wide range of topics about the machine, from how to set it up and switch it on to handling disks carefully, through the intricacies of the fonts system to full details of all the CP/M system calls, both standard and extra. Full details are given of all the machine's features and a section contains careful instructions on using all the CP/M

utility programs, with plenty of screen pictures to show you what should happen. The manual is clearly and concisely written in flawless American English with none of the hilarious mistranslations which livened up some earlier examples of Japanese documentation. As mentioned earlier, I was not supplied with the MFBasic manual but I would confidently expect it to be to the same standard. The manual should be very useful for both the computer-naive business person and the experienced programmer looking for solid technical details.

Applications

The basic machine comes with no applications software at all. Epson (UK) has, however, done a deal with Peachtree so that all that company's accountancy and office productivity software, including the Peachtext (nee Magic Wand) word processor, a much nicer thing that the universal Word-Star as far as I am concerned. Epson is also making Personal Pearl available and other third-party vendors are being encouraged to put their software onto the QX-10; certainly Caxton has made Cardbox available on the machine, and no doubt we'll be hearing of others joining in pretty quickly.

An American company has produced a system called Valdox based on the QX-10. I've heard wonderful things about this package: it's supposed to be a complete business system not unsimilar in some ways to Apple's Lisa software and includes what has been described to me as a very good word procesor. But it won't run on a standard QX-10 as it requires considerably modified hardware and, although there is what Epson describes as a 'very good chance' that it will be sold here some day, this depends very much on pricing and whether or not the Valdox system is fully debugged — apparently it isn't yet.

Conclusions

This is the best 8-bit CP/M computer I've yet seen. It is beautifully and robustly made: a lot of careful thought has gone into the design of the system, in terms of the facilities put into it and into the production engineering aspect. It is intended as a serious business computer and has all the facilities built in to fulfil this role perfectly — within the constraints of CP/M, of course. The ergonomics are excellent (apart from the lack of screen tilting) and the keyboard is a joy to use.

Compared to many 8-bitters now on

MICROMART

The SATURDAY dBASE II INTRODUCTORY COURSE

This course enables a rapid grasp to be gained of using database packages, in particular dBASE II (TM: Ashton Tate), on micros under CP/M. It is planned for those who have litte or no prior knowledge of data base systems on computers, or dBASE II, and starts virtually from scrach covering:

- Introduction to Micros & CP/M

- Databases on Microcomputers
- Introduction to dBASE II
- Hands on use of dBASE II
- System design for dBASE II
- Programming in dBASE II
- Practical work on dBASE II
- Programming aids & style

Numers are **strictly limited** to not more than 20 delegates. Registration is at 0900-0915, lunch 1300-1415, and conclusion at 1800. Several micros are used for hands on work including: Osborne, Sirius, Televideo, Galaxy, etc. Four lecturers are present so as to ensure that every delegate receives individual help in the practical sessions.

The next course is on Saturday JUNE 4th. Currently planned dates are for the following SATURDAYS at a West London hotel:

June 4, 18 July 2, 16, 30 September 10, 24 October 15, 29

October 15, 29
Cost: £90 + VAT payable in advance but with scaled refunds if cancellation within specified notice periods. Cost includes course material, meals and refreshments, and a copy of Arthur Green's book: "dBASE II User's Guide". Payment by Cheque, PO, Access or VISA. Detailed explanatory leaflet available with fuller description. To make a booking or to obtain further details, telephone or write to: Steve Conlon at:

the market, it may at first seem rather expensive. But of course the price does include a good-quality display and there are all those lovely frills. Epson has proved beyond all doubt that, just because there are lots of 16-bit microcomputers around, we shouldn't write off the 8-bit CP/M-80 machine as a dodo. Far from it: there's still a lot which can be done to make this type of valuable and versatile machine a business tool.

The time is fast approaching when I will have to buy a second 'grown-up' computer to supplement my Sirius. I had more or less resigned myself to buying an IBM on the grounds that, overpriced though it undoubtedly is, the vast flood of software about to hit us from the States would make it more or less compulsory for someone in my line of work. Having now seen the QX-10, I have changed my mind. The Americans can damn well adapt their 16-bit software to the Sirius if they want it evaluated!

65k memory upgrade: £50 (estimated) **£TBA** Peripherals and add-ons:

SBORNE EXECUTIVE

continued from page 179

Most users of the Osborne 1 queue up for a neat little patch to WordStar, which stops that program pretending that it is sending display characters down a serial line to a dumb terminal, and makes it print them direct on the screen.

WordStar normally sends cursor address signals to the screen handling routines of the Console Command Processor in CP/M, which then moves the cursor, then comes back for the character, then asks for the cursor position, and so on. Cut that out, and the result is that Osborne 1 WordStar is one of the quickest text editors you ever saw, because it can update a screen faster than you can

It also gave its users the option of a 128 column display (only 52 visible at any one time. If and when you produced a document that was over 79 columns wide, you could see it exactly as it would print out, whereas normal WordStar users would have to put up with lines that took two lines on screen).

For this version of WordStar, MicroPro spotted that this was daft, and produced a system of horizontal scrolling exactly like the Osborne horizontal scroll so that, as you typed across the screen, the whole screen moved to the left.

But it did this with cursor addressing, You can go mad, watching a horizontal scroll; but you can go mad in spades watching it happen, line by line, with cursor addressing.

If horizontal scrolling is bad, why use WordStar's latest version? And if it's good, why throw it away?

CP/M plus

Most changes from ordinary CP/M to CP/M Plus are ones which the user won't notice - bar one. There will be no more moments of 'Horrors, Bdos Error!' because it automatically logs onto a diskette as soon as it goes into the drive.

Most improvements to CP/M Plus lie in the speed and sophistication of diskette handling. This is not the moment for an explanation of what one means by 'hashed directory access', or 'least recently used sector buffering' or 'multi-sector 1/0 primitive', beyond saying that they can enormously speed up programs that use the disks a lot, and they are all features of CP/M Plus.

It can also speed up the way the system handles the screen, and the way programs and program overlays are loaded.

However, it is clear that programs designed for the larger memory space, better screen handling and faster disk abilities of this operating system, will absolutely walk over those that are built round CP/M 2.2 In particular, when hard disks are more available, the ability to have files of 32 megabytes on disks of up to 512 megabytes capacity will enormously improve database managers.

In the circumstances, I found it easy to agree to Osborne engineers' requests not to run the benchmarks. Their objections were on the grounds that the performance improvement in MBasic programs might not be shown on the final production machines, if somebody puts more wait states' into the circuit board. My objec-

tions to the project were simpler: a) the MBasic interpreter is identical; b) there was obviously no change in the approximate speeds (a two per cent speed increase was indicated, which is not enough to write home about); and c) it would be a complete waste of an afternoon's hard graft with stopwatch and keyboard, because it totally ignored all the new go-faster features of the machine, in favour of testing a language which is very little used for commercial applications.

Overall impressions

This is the year of the IBM personal computer, 16-bit software, and MS-DOS.

As eight-bit systems go, the new Osborne — to be launched this month although shipping to the UK will not start until September — offers a lot of software for a reasonable price — and several performance improvements over standard CP/M systems. But it does remain disappointing in terms of what one might

have expected.

Quite what the 16-bit version will be like, only time will tell. All we know at the moment is that it will offer colour, probably an extra application package (like Lotus 123 or Visi0n) and two 16-bit operating systems. We also know that a company called Personal Computer Products has just announced a deal with Osborne, to design the 8088 co-processor card for the Executive II.

By the time that machine is ready, there will be more than one portable on the market capable of running IBM personal computer software. One of them may even be an IBM machine.

On the positive side, the machine answers most criticisms of the Osborne 1, and looks good value for money — the UK tag is expected to be £2000 or so. And Osborne is now established with enough dealers, and in enough corporate buying plans, that the upgrade will probably be a noticeable success.

All it needs, really, are double-sided diskettes, and a 132 column scrollable 'window' screen.

LEISURE LINES

by J J Clessa

Quickie

What gets longer the more you cut it at the ends?

Prize Puzzle

Susan's perfect man has black hair, brown eyes, and is tall and slim.

Susan knows four men — Arthur, Bill, Charles and Dave — only one of which has all the characteristics that Susan requires.

- 1 Arthur and Bill have the same colour eyes.
- Only one of the men has both black hair and brown eyes.
- Bill and Charles have the same colour hair.
- 4 Only two of the men are both tall and slim.
- 5 Charles and Dave have different builds.6 Only two of the men are both tall and
- dark-haired.

 7 Dave and Arthur are the same height.
- 8 Only three of the men are both slim and brown-eyed.

Which is Susan's perfect man?

April Prize Puzzle

One hundred and twenty-eight entries — but since twenty-nine of these were not on postcards, they were immediately disqualified. This left 99 possibles — most of which contained the right answer.

The winning entry — selected at random — came from George Sassoon of Warminster, Wilts. Congratulations Mr Sassoon, your prize is on its way.

The answer is that 89 or 98 requires the greatest number of operations, 24 in all, before a palindromic number is reached.

Several of you have pointed out that we frequently omit the closing date for entries, and the address to which they should be sent. We will try to rectify this in future, but just for the record:-

Closing date for all entries is the last day of the month of the magazine issue. Mark your entries with the puzzle date, for example, 'Prize Puzzle (month) 83', and send them to Leisure Lines, PCW, VNU Publications, 62 Oxford St, London, W1,

Keep puzzling.

MEMOTECH

The All-Purpose Computer

The MTX500

The MTX500 is a new departure in micro-computer technology. Whether your needs as a user are for personal programming, games playing, scientific or process control, educational or business use the MTX500 is already capable or very easily adaptable to almost every application. Glance through the standard features below – you'll see what we mean.

Software

The MTX500's 16k ROM contains several languages and routines which enable the novice or the experienced programmer to make full use of the machine. Standard languages are MTX BASIC, LOGO and NODDY. ROM routines include an ASSEMBLER/DISASSEMBLER with screen display of the Z80 CPU registers, memory and program which can be manipulated from the keyboard. Machine code programs can be stepped through one instruction at a time, and easily called from within BASIC

programs. A further feature is the Virtual Screen facility which enables the programmer to define sections of the screen to work independently whilst maintaining all full screen facilities. Pascal is available as an add-on ROM pack.

Hardware

As standard – 32k of user RAM expandable to 512k plus 16k of dedicated video RAM. Sixteen colours, 40 column text, 256 × 192 high resolution graphics with all sixteen colours available and easily moveable user defined graphics (Sprites) combine to make effective screen displays quick and simple to achieve. Standard outputs are centronics printer

PLUTO

A BREAKTHROUGH IN COLOUR GRAPHICS

PLUTO is an intelligent, high performance colour display controller that is both compact and affordable:

Technical Profile:-

- 8" x 8" PCB
- 640 (H) x 288 (V) x 8 colours
- 16 bit Intel 8088 microprocessor
- 192 Kbytes of dual ported memory
- Fast parallel I/O interface for connection to most computers

Use PLUTO with any machine

PLUTO'S in built software gives fast access to a comprehensive command set:-

- High level software protocol.
- High speed vector drawing. (over 150,000 pixels per sec.).
- Built-in character display freely mixable with graphics.
- On-board storage of user-defined symbols.
- Complex polygon flood fill

An extended command set ROM is available providing the following functions:-

- Raster operations with rotation in multiples of 90*.
- Complex polygon colour and pattern fills.
- Circles and arcs, etc.

Prices:-

PLUTO £399 + VAT
BABY PLUTO (320 x 288) £299 + VAT
DOUBLE RES. OPTION £50 + VAT
8 MHz PROCESSOR OPT £50 + VAT
EXTENDED COMMAND ROM £60+VAT

NOW . . . FOR ZX SPECTRUM USERS EVERYWHERE

THE FULLER BOX ...

A NEW DIMENSION IN SPECTRUM CAPABILITY

It's easy to see why the ZX Spectrum is outselling all the other small colour computers, it really is a marvel of new technology. Equally marvellous is the new 'Fuller Box' for your Spectrum. Sound Quality is improved enormously with the built in Audio Amplifier which works with all Spectrum programs. The Sound Synthesiser will make any sound you want to design: explosions, laser blasts, trains, birds etc. It's based on the popular G1-AY-3-8912 chip, and is supplied with a demo program. Finally, the Joystick Port enables you to use any low-priced Atari/Commodore joysticks with your programs.

The Fuller Box fits neatly on to the back of your ZX Spectrum, and does not re with any peripherals, PRICE (INC. VAT)

interfere with any peripherals, including the new Spectrum microdrives.

PRICE (INC. VAT)

£29.95 +80p p&p

But the story doesn't end there! The Fuller Box has been designed to perform many other functions, and extra, expanded versions are already available.

The Master Unit The Ultimate Games Unit Provides all the requirements for the serious Spectrum games enthusiast. It contains the Fuller Orator, Joystick port, sound synthesiser, and audio amplifier. The Master Unit also provides endless scope in application via its duplicate user port.

THOUSANDS OF PEOPLE FROM HUNDREDS OF PLACES WILL VISIT

You should be there, too, if you're looking to make the most of the pre-Christmas selling period.

Because the thousands of visitors who will come to the first major personal computer and leisure technology show to be held in the West of England will be Christmas computer shoppers, with money to spend on the latest computers and electronic innovations which will be on show.

So if you manufacture or supply computers, software, books, video games or other accessories make sure you exhibit at HomeTech '83.

And have yourself a very merry Christmas.

How has Comart's controlled, down to earth development strategy kept Communicator a firm favourite in the UK, and the leading candidate to reverse the tide of microcomputer imports?

New Range Additions The Communicator range has broadened to add a new 20 Megabyte 5" Winchester Hard Disk Drive System to the already well established 5 Megabyte and floppy diskette models. Another new system offers 8" floppy disk drives for compatibility of data transfer. With the associated tape and additional Winchester back up systems that adds up to eight basic models – all in the same neat, stackable, casing – all based on \$100 bus construction to keep future options in memory, users, peripherals and interface requirements wide open.

New System Additions Communicator operating systems continue to broaden both in options and facilities. An improved CP/M offers enhanced diagnostics, for example, and auto boot from Hard Disk. These basic improvements are reflected in the now tried and tested Communicator multi-user MP/MII™, which also provides for full CP/M™ compatibility.

New Communications Options

Communicator now offers CP/Net[™] and RBTE communications protocols. Individual Communicator

Systems can now operate as intelligent information terminals, integrated with either existing mainframe or mini computer installations, or be part of a shared resource or communications network.

New Range of Terminals Find out more about Comart's new smart VDU. It's a new advanced ergonomically designed unit. It has a 105 keyset detached keyboard, soft green phosphor tilt screen, and a low profile foot. Its a perfect complement to the Communicator in both styling and performance.

Some things don't change Communicator still has Comart's established dealer network and nationwide after sales service back up, supporting thousands of Communicators already at work throughout the UK.

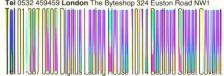

And in the Future? Behind all these innovations are advanced programmes of research and development. Soon Comart will be bringing you 16 bit, multi processor and distributed processing systems. This is your guarantee that Communicator will continue to keep pace as microcomputer technology progresses.

To find out more about Communicator today, call us now on 0480 215005.

DON'T JUST STAND THERE...

USE THE FAST LANE

28th September-2nd October Barbican Centre, City of London

The PCW Show is Britain's most popular micro event. Hardly surprising, with over 200 exhibitors showing an exciting range of micros, software and peripherals—for business and commerce, education, science, industry and the home.

But if you use a micro at work

(or are thinking of buying one) you can avoid the crush. Just clip the coupon below and send ith with your business card and a cheque for £2.00 (normal price £3 at the door!). We'll send you a special "Fast Lane" ticket. And you won't have to play the waiting game.

THE FAST LANE

Plese send me one "Fast Lane" ticket to the 6th PCW Show.

I enclose my business card and a cheque for £2.00 made payable to the "Personal Computer World Show".

MASTER

MASTER is a totally new concept... a complete package for program development. Used by top professionals in the USA and Europe, MASTER has everything you need to write your own software, to the highest professional standards... up to 85 new commands that work with CBM Basic IV... and just one command can replace whole paragraphs of Basic code. That's why Master is...

a new concept in CBM Basic

MASTER has 17 DISK HANDLING commands (both keyed and sequential access, masked retrieval, batch operation, existence tests, etc)... 12 INPUT MANAGEMENT commands (input/output screen zones, with alpha, numeric and date formatting, etc)... 8 SCREEN MANAGEMENT commands (with screen pages loadable from disk or memory)... 10 commands for REPORT MANAGEMENT (with disk-loadable report formats)... 18 BUSINESS BASIC commands (with 20-place arithmetic, data compression, automatic date control etc)... and on the CBM 8096, all the features of PM96 (46K for programs, 26K for variables, as well as 17 BASIC UTILITY commands).

now available for the CBM 64

... including the full CBM Basic IV command set, and all the MASTER features listed above! Supplied on a CBM 1541 diskette, with a cassette port security key, MASTER 64 is the most powerful software utility ever offered to personal computer users! MASTER also supports CBM/PET models 4032, 8032, 8096, (and 8032 with CP/MAKER), as well as the CBM 4040, 8050 and 8250 floppy disks, plus the CBM 9060 or 9090 hard disks, and is supplied with a User Reference Manual, Quick Reference Guide, Installation Guide, Demo Disk, and with a security key for either cassette port.

PM 96 for the CBM 8096

EBM 8096 users can at last make full use of their 64K Expansion Memory... with PM96, the only product that offers sophisticated, yet simple, dynamic memory management... as well as 17 extra commands that work with CBM Basic IV. 82K of memory is available to the user, with 56K for programs (up to 16 together!), and 26K for variables (maintained even while editing or loading!). The new Basic commands include all the TOOLKIT functions, plus PRINT USING, IF-THEN-ELSE, STOP KEY disable, HARDCOPY screen dump, CALL, FETCH, PLOT (50 by 150), WINDOW, and more. PM96 comes with a User Reference Manual, Quick Reference Guide, Disk with demo programs, and UD11 Support Rom.

Better books from Sunshine

A collection of sophisticated Basic programs and subroutines including Unifile, Renumber (handles Gotos and Gosubs) education, accounts, games and scores of essential routines. Put your Spectrum to work with what must be the most comprehensive Spectrum book. 248pp £5.95*

Some of the more advanced programs in this collection include a word processor and text editor, a music and sound synthesiser, a sprite editor and a program which allows you to enter high resolution graphics mode. This is not available in the standard Basic. 160pp £5.95*

This computer has capabilities far beyond most other computers in this price bracket. With this collection of Basic programs and routines David Lawrence introduces word processing, music and shows you how to mix text and high resolution graphics. As with the other books in this series, each program is built up out of re-useable subroutines. 160pp £5.95*

*Available through W. H. Smith' and computer dealers.

Bring some Sunshine into your life

Behind the wheel of your machine, Cruising on Broadway. You look mean. People stop to stare. Suddenly a black-and-white pulls onto the Broadway behind - its light flashing and siren wailing. The chase is on!

Cruising on Broadway is a tyreburning fast machine-code game for the 16 & 48K Spectrum. The further you can get the more difficult it becomes - cash prizes are being offered each month for the highest scores. £4.95*

aculty of Mathematics - University of Belgrade

Trapped in an endless maze populated only by vicious androids your only objective survival.

You have a lazer of course and can withstand a few blows, but you'd better be quick on the draw, these guys are designed to kill. Maybe you can find an but escape is impossible and your replenished resources won't last long.

The fastest, most headspinningly demanding game you'll ever play. £5.95

A deadly duel, deep in space, Blind Alley is what passes for sport in the year 3017. Your craft must use strategy to outwit and corral the opponent in this crazy development of the pursuit games of the late 2600s. After each round in the enclosure game more players are sent against you to test your skill and agility. Blind Alley is the machine-code action of the future - now! For the 16 & 48K Spectrum. Blind Alley can be played with a Kempston Joystick. £4.95*

Galaxy Attack An amazing three part hybrid of adventure and arcade action. Your task will take you through the depths of space to a crash landing on a far flung planet where you race against time to repair your crippled ship before the walkers get you. You probably won't make it but if you do the third and final part of your incredible journey will Galaxy Attack is totally machine coded and will only work on the 48K Spectrum. £5.95

SPECIALLY

Quick thinking and dexterity are required to master this high speed chase game. Use the keyboard to travel

around a maze — try to cover it all before the chaser gets you. All you have to help you is the ability to make a gap in the track which may slow your enemy up a bit but watch out — things only get tougher — the mazes get harder and more chasers

A high speed all machine code challenge guaranteed to raise your Adrenalin to new heights no-one has yet mastered the highest levels. £6.95

Swordfight at Midnight

game, Swordfight at Midnight presents you with a duel to the

death between two swordsmen

program whose possibilities will be exhausted in a day or even a

week. What it has in common

demand for quick reactions to

of skill and tactics that will open up endless new ways of approaching the duel. An important aid to learning these skills is a "playback"

facility which enables you to watch the game that has just

taken place and spot your errors. £5.95*

VIDEO MONITORS

RECHARGEABLE BATTERIES CYCLON type D001 sealed lead acid maintenance free 2v 2.5 ah. will deliver over 300 amps on short circuit!! Brand new at

2" CASED. Made by the British KGM Co.

Designed for continuous use as a data display station, unit is totally housed in an attractive brushed aluminium case with ON-OFF, BRIGHTNESS and CONTRAST attractive brushed aluminum case with On-OFF, BRIGHTNESS and CONTRAST controls mounted to one side. Much attention was given to construction and reliability of this unit with features such as, internal transformer isolated regulated DC supply, all components mounted on two fibre glass PCB boards—which hinge out for ease of service, many internal controls for linearity etc. The monitor accepts standard 75 ohm composite video signal via SO239 socket on rear panel. Bandwidth of the unit is estimated around 20 Mhz and will display most high def graphics and 132 x 24 lines. Units are secondhand and may have screen burns. However where burns exist they are only apparent when monitor is switched off. Although unguaranteed all monitors are tested prior to despatch. Dimensions approx. 14" high x 14" wide by 11" deep. Supplied complete with circuit. 240 volt AC operation. ONLY Feb. 00 PLUS Ep. 30 CARR.

operation. Out 149.00 PLOS £3.50 CMR.

24" CASED. Again made by the KGM Co with a similar spec as the 12" monitor. Originally used for large screen data display. Very compact unit in lightweight alloy case dim. 19" H x 17" D x 22" W. All silicon electronics and composite video input make an ideal unit for schools, clubs, shops etc. Supplied in a used but working condition.

ONLY £55.00 PLUS £9.50 CARR. & INS.

14" COLOUR superb chassis monitor made by a subsidiary of the HITACHI Co. Inputs are TTL RGB with separate sync. and will plug direct into the BBC micro etc. Exceptional bandwidth with good 80 col. definition. Brand new and guaranteed.
Complete with full data & circuit. 240 v AC
working. Dim. 14" x 13" x 13".

JUST LAUNCHED ORIC TREK SPACE ADVENTURE GAME

You are in command of the Federation's most powerful starship the USS Enterprise. Armed with your phasers and photon torpedoes, your task is to patrol the furthest reaches of the Galaxy, protecting Federation space against the forces of invading Klingons. Your ultimate mission is to rid the Galaxy entirely of the Klingon menace...before they destroy you. Your crew awaits you aboard the Enterprise. Starfleet Command wishes you Bon Voyage and Good Hunting!

ORIC products available from:-WHSMITH • DIXONS • GREENS LASKYS • MICRO'C' • MICRO PERIPHERALS • SPECTRUM **COMPUTERS FOR ALL** And hundreds of independent dealers.

जा में दिन VEW

66 The sound commands on the Oric 1 are, for a computer of this price, very sophisticated. Three music channels, and one noise channel, mean that you can program some fairly complex sounds. 99

POPULAR COMPUTING WEEKLY

66 Oric is everything you hoped it would be. Alive with colour, and zapping with built-in sound effects, the Oric looks like a match for any machine now selling for less than £200 99

YOUR COMPUTER

*6 The 16k Oric - fighting the 16k Spectrum - is 5.25 cheaper. It feels a good deal more 'professional' than the home-appeal Sinclair. Oric's sound is extremely versatile, and well up to the standard of the £300 or £400 BBC microcomputer made by Acom. 99

WHICH MICRO?

66 Oric will soon be selling a Modem so that Prestel will become available. Owners will be able to accept telesoftware programs loaded straight down the phone line eventually electronic mail could come into the home by the same route, and with the addition of a tape recorder the Oric with its Modem could become a telephone answerer and message taker. 99

YOUR COMPUTER

66 Instead of the Spectrum's 28 look-up single-character error reports. the Oric has 18 self-explanatory messages If you actually want to do computing, rather than just exploring the world of off-the-shelf games programme entertainment the Oric will be a better buy. 99

WHICH MICRO?

66 Oric was over twice as fast as the Spectrum. Surprisingly perhaps the Oric, which initially seemed only faster when performing the simplest of calculations, has come back to beat the Spectrum by a small amount. As the problems get more complex the Oric comes into its own. One final point - in entering the benchmark tests - the Oric was certainly the easiest to handle. ??

WHICH MICRO?

66 This slope coupled with the design of the keys makes the Oric an easy machine to touch-type on. All keys have auto-repeat and there are four keys dedicated specifically to cursor control. It is certainly easier to type on than any of Sinclair's offerings. 99

YOUR COMPUTER

66 One good feature of the Oric is an on-screen reminder in the top right hand corner to show that you've engaged all-capitals mode. So much better than the BB's variety of lights in the corner of the keyboard. The Oric is sound, simple to get along with and offers great expansion potential. ??

WHICH MICRO?

66 When compared to the stogginess of the Spectrum's keyboard this is certainly an improvement. I can't see any Orics failing through bad assembly. If only the £2400 IBM were so easy to use. 99

WHICH MICRO?

66 A good speaker and built-in noises get the Oric's sound off to a good start. Typing Zap, Ping, Shoot or Explode produces convincing arcade game noises which can easily be incorporated into any program. 99

YOUR COMPUTER

66 The modern is certainly unusual in a machine of this price. Together with the other peripherals, when finally available, it should make for an attractive package for a small business...surely a match for machines costing

Sirius Approved Product

SIRIUS 80 CARD

CP/M-80 for the Sirius 1

The SIRIUS 80 Card now manufactured by Sirius Systems Technology under licence for Small Systems Engineering adds a new dimension to the capabilities of the Sirius 1. Simply plugging in the card and typing "80" opens the door to the world's most popular operating system, CP/M-80, giving access to thousands of application packages, languages, compilers, development tools and programming aids.

- A copy of true CP/M-80 not an emulation is included with every card.
- A single command is all the that's needed for the system to alternate between CP/M-80 and CP/M-86. Files generated under either operating system are identical in structure, providing compatibility between the two
- Drive 'M' RAM disk facility enables areas of RAM to function as high speed disk
- Corvus hard disk drive interface allows up to 64 Sirii to share the same 6, 10 or 20 Mb drive, with high speed video tape back-up.
- I.O. address selection ensures complete compatibility with other Sirius plug-in
- Full 6 MHz operation with its own 64K of RAM.
- Comprehensive documentation is included, and a complete set of programming utilities, including Corvus drivers for MS-DOS
- The simple-to-fit Sirius 80 Card has over 2000 installations world-wide. £365

Applestop

HELP SCREEN UTILITY FOR THE APPLE II and IIe.

Allows help screens to be created and easily displayed at any time from within a program. Can also be used to provide menus and other instructions, data lists etc.

Supports multiple screens within a single program.

Access time 1/8 0.05 sec. via simple 'call'

Original text screen replaced unchanged after help screen display. Easy to use - example program provided. Supplied on DOS 3.3 diskette

£18.95 inclusive of V.A.T. and postage.

BIG FILE

ALLOWS 370K + DOS TEXT FILES!!

Allows a single DOS text file to be spread over two or three disks. No changes to existing programs are necessary and records are accessed as normal in a random access text file.

£12.95 inclusive of V.A.T. and postage.

PRO-FORMA

Allows the design, printing and completion of any type of forme.g. application forms, reports, returns, etc.
Forms may be designed and the format, titles, other text and

data information saved to disk.

Any form can be completed, whether it is designed using the system or is an existing internal or external forms, with the user being prompted by field name for the data to be inserted in each position. All data entered is checked for validity and size. Multiple copies of blank or completed forms can be printed.

£21.95 inclusive of V.A.T. and postage.

Verbatim®

SuperSoft. ScratchPad 3.0

CP/M[®], CP/M-86[®], MS DOS, IBM PC DOS NEVER SEE "OUT OF MEMORY" AGAIN

ScratchPad 3.0 is at the forefront of electronic spreadsheet development. Its advanced features and capabilities make it a powerful tool for business planning, "what if" analyses, financial modelling and decision making.

ScratchPad's matrix of rows and columns gives you complete control over the entry, cross-referencing, and mathematical analyses of data of all kinds.

ScratchPad 3.0 supports many advanced features not found on lower quality spreadsheets. These features include:

Flexible Spreadsheet

A ScratchPad innovation. Now you can design the spreadsheet to fit your application, rather than redesigning your application to fit the spreadsheet. The matrix dimensions are up to you.

Virtual Memory

You can now use every cell in the spreadsheet. Don't be misled, other spreadsheets tell you how "big" the matrix is, but you can only use a very small portion. With Scratchpad's virtual memory feature you can use EVERY CELL up to maximum 25,000 entries.

Consolidation

This allows you to combine values from many different spreadsheets into a new "master" spreadsheet that contains either the sum or the average of the others. For example, monthly sales figures from several spreadsheets can be consolidated into one yearly spreadsheet. This feature is invaluable to businesses of any size.

Merge

Spreadsheets saved on disk can be merged with the current spreadsheets to give you greater use of previously recorded data.

Unlimited Window Splitting

A ScratchPad exclusive! This helps you quickly understand the results of "what if" analyses by keeping your screen movement to a minimum.

If/Then

Allows the use of conditional statements.

Automatic or Manual Calc Modes

Lets you decide when recalculations will occur.

Format Control

Lets you format numbers globally or at specific locations, commas, or (in the case of intermediate values) invisible format.

Print

You can specify rows and columns to be printed and printout to either printer or disk.

- Replicate the contents of Rows, Columns, or Points
- Zero the contents of Rows, Columns, or Points

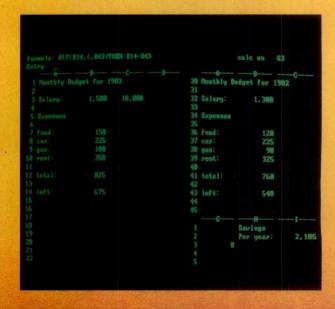

Vary Column Width

- Delete or Insert Rows or Columns
- Erase Spreadsheet
- Jump between windows

ScratchPad also has a complete complement of built in functions, including:

functions, including: ABS, ATN, AVG, CHOOSE, COS, COUNT, EXP, FAC, IF/THEN, INT, LOG, LOOKUP, MAX, MIN, PI, SIN, SQR, SUM, TAN

Arithmetic functions have 13 DIGIT BCD PRECISION.

Your IBM PC: A GUIDE TO THE IBM PERSONAL COMPUTER BY LYLE J GRAHAM

Packed with information and resources, this book is written for both beginning and experienced computer users and will serve as a day-to-day guide and as a reference. For beginners it provides an overview of personal computer hardware and software, clear step-by-step operating instructions, and where appropriate, detailed explanations of the computer's internal operations. For the more experienced user, the author covers advanced IBM BASIC programming, DOS, graphics and sound, the printer interface and the I/O interface, machine language and the monitor. This is an indispensable book for all IBM PC users.

Data Base Management Systems: A GUIDE TO

MICROCOMPUTER SOFTWARE BY DAVID KRUGLINSKI

You'll be able to evaluate and select a data base management system to meet your particular business requirements after reading this book. It defines the capabilities of the 3 categories of data base management systems: File, Relational and Network/Heirarchial and examines many of the more popular packages, some of which run under the CP/M

operating system, including: Condor Series 20, dBase II, FMS-80, DataStar and others. With the facts in this book, any microcomputer owner can make intelligent decisions about data base management systems for their business.

Learning with Logo
BY DANIEL WATT

Logo is a fascinating new computer language. This comprehensive guide is written to be useful to children as young as 9 years old, as well as adults. Many pictures and examples, clear descriptions of commonly experienced bugs and pitfalls, and sample projects such as simple and complex turtle drawings in black and white and colour, animated computer games,

ZX81/TS1000
Programming for Young
Programmers (UK)
BY LINDA HURLEY

The ZX81 computer is becoming evermore popular both in schools and homes, but in order to teach youngsters the techniques required to become proficient in programming the ZX81, they need instruction that will hold their interest and provide entertainment. This book, to be published in July, teaches young programmers from 9 years upwards the fundamentals of BASIC programming, in a way they'll find both educational and exciting. A software cassette to accompany the book is also available. This contains listings in the book, plus ideas for routines that will help the adventurous programmer design and write their own simple games programs. Also included are 3 games not contained in the book. The cassette will be

available in July. 07 084595 6 (Book) 07 084700 2 (Cassette)

Word Processing Buyer's Guide

Filling the need for a word processing buyer's guide that is neither too complex nor too superficial for the experienced computer user, this thorough guide shows how word processors enable all kinds of writers to edit, rearrange, reformat and print their documents electronically with dazzling speed and efficiency. It examines such areas as letter-quality printers, storage systems, terminals, keyboards and video monitors. Helpful appendices feature conversion tables, a bibliography and an extensive word processing glossary, and so make this an invaluable guide to the prospective word processor owner.

CAMBRIDGE UNIVERSITY PRESS

Linsac's ZX Companion series has received excellent press reviews:

TFar and away the best" - Your Computer

Thoughtfully written, detailed and illustrated with meaningful programs ... outstandingly useful" -EZUG

'The Spectrum Games Companion' is the latest addition to the series and is aimed at the games player and programmer alike. Twenty-one games designed specifically for the ZX Spectrum are included, with clear instructions on entry and play. Each program is explained fully with complete details on how it is designed and written. Introductory chapters show how to set up and use the Spectrum and how to create your own games. Later sections cover number games, word games, board games, simulation

games, dice games, card
games and grid games. If
you want to enjoy your
ZX Spectrum and learn
its secrets at the same
time then this is the
book for you!

Bob Maunder is coauthor of 'The ZX80 Companion' and author of 'The ZX81 Companion'. He is a Senior Lecturer in Computer Science at Teesside Polytechnic, holds an MSc degree in Computer Science, and is a Member of the British Computer Society.

The Spectrum Games Companion is available from good book shops, or send £5.95 to:

Hundreds of problems. One solution.

LINE 1 GREEN Supervisor: STOCK Time 14.47 Line status: C On/Off. On Tons filled: 8.33 Bags filled: 504 units Breakages: 16 units Down time: 0 minutes Hopper 1: 33% Hopper 2: 41% Hopper 3: Not in use Hopper 4: 38% Production efficiency this shift: 73% Notes

Controlling the production of tomato grow bags may sound simple enough, but co-ordinating all the different aspects on a brand-new production line was not without its headaches. When the production manager turned to the company's new micro for an answer, it was THE LAST ONE which made it possible to create a system in hours rather than months. TLO then went on to produce over one hundred individual solutions for this company in a period of less than a year.

A simple, moving, graphic display was needed by a major computer retailer to demonstrate how a new product line could maintain compatibility with some of his earlier machines. Half an hour's work with THE LAST ONE and he had a program displaying bar-charts, graphs and printouts. Little more than an hour later the same program was up and running on three other makes of micro. When asked what made the four machines compatible, he laid the credit squarely with THE LAST ONE – "some manufacturers would be hard put to even use the same mains plug – TLO at least gets them all speaking the same language."

The biochemistry department of a major Scottish university had a need for a filing system which could store details of abstracts of biochemical articles and which would allow retrieval of relevant material through entry of key words alone. A massive database had to be implemented on an Apple II computer and retrieval times needed to be measured in seconds not hours. TLO did it and the solution has since been widely published for use on other machines.

Using a computer to solve a complex problem is not always as easy as it sounds.

One solution that has helped solve hundreds of problems in installations throughout the world is THE LAST ONE (TLO).

A glance through the three examples on this page will give you some idea just how versatile TLO is.

TLO runs on the Apple II and IIe, Commodore 4032 and 8032/96, TRS-80 Model II (TRSDOS or CP/M), most CP/M, CP/M 86 and MS-DOS machines including the IBM PC (PC-DOS) and Sirius.

Try out TLO for £50 + VAT

A limited demonstration version of TLO is now available for just £57.50 including full documentation, VAT, postage and packing. This is fully refundable against purchase of the full version.

Find out what TLO can do for you by sending today for a free information pack. It could be the solution to hundreds of your problems.

COR! Level 9 Computing's EPIC ADVENTURE GAMES are now available for 32k (or more) versions of the:

ATARI 400/800 COMMODORE 64 LYNX

as well as for the:

BBC NASCOM & SPECTRUM!

COM OM SPECTRUM

GIANT AD TURE GAMES

- 1) COLOSSAL ADVENTURE: The classic mainframe game "Adventure" with all the original treasures & creatures + 70 extra rooms.
- 2) ADVENTURE QUEST: Through forest, desert, mountains, caves, water, fire, moorland and swamp on an epic quest vs Tyranny.
- 3) DUNGEON ADVENTURE: The vast dungeons of the Demon Lord have survived His fall. Can you get to their treasures first?

Every Level 9 adventure has over 200 individually described locations and is packed with puzzles - a game can easily take months to complete. Only sophisticated compression techniques can squeeze so much in! Each game needs 32K and costs £9.90

BB G FORTH, FORTH TOOLKIT

'r q FORTH" runs on 16K or 32K BBC Level 9 Computing are pleased to micros and costs £15. It:

follows the FORTH-79 STANDARD

- and has fig-FORTH facilities; provides 260 FORTH words:
- is infinitely extensible; has a full-screen editor;
- allows full use of the M.O.S;
- permits use of all graphic modes. even 0-2 (just!);
- provides recursion easily;
- runs faster than BBC BASIC: needs no added hardware:
- includes a 70 page technical
- manual and a summary card;
- has hundreds of users

announce a new toolkit for "r q FORTH" on 32K BBC micros.

- It costs only £10 and adds the following facilities to FORTH:
- a 6502 assembler, providing machine-code within FORTH;
- turtle graphics, giving you easy-to-use colour graphics;
- decompiler routines, allowing the versatile examination of your compiled FORTH Programs;
- the full double-number set:
- an example FORTH program; and demonstrations of graphics;
- other useful routines.

TUNITY(S)

SALES OPPORTUNITY(S)

An opportunity to join one of the UK's most progressive electronic consumer durable distributors in their launch of a range of Home Computers.

We already have an established field sales force actively selling our existing product range to department stores, brown goods and toy retailers etc. We need two Home Computer Specialists to support that sales force and, when directed, create their own prospects/customer base.

Candidates will be expected to have software experience, particularly basic programming, and a technical appreciation of the Home Computer market. They must be able to demonstrate their sales ability and be self motivated.

Competitive salary, company car and usual large company benefits. Full C.V. to the:

THE

MIRACLE

IS

COMING

Virtual Library of Faculty of Mathematics - University of Belgrade elibrary.matf.bg.ac.rs

PORTICO TEC

It's the micro you've been waiting for.

A computer that's equally at home as a big-screen portable or as a compact, stylish desk-top business machine.

With the power you are looking for, at a price that's a breakthrough in value.

Incorporating all the latest developments to give it the specifications you want.

And a performance way ahead of the crowd.

Because every Miracle comes with more than a thousand pound's worth of integrated software – word-processing, data management, financial planning, communications – all the software you need, in fact, to use the Miracle as a complete business system without spending another penny.

So if you're in the process of buying a micro, a word of advice.

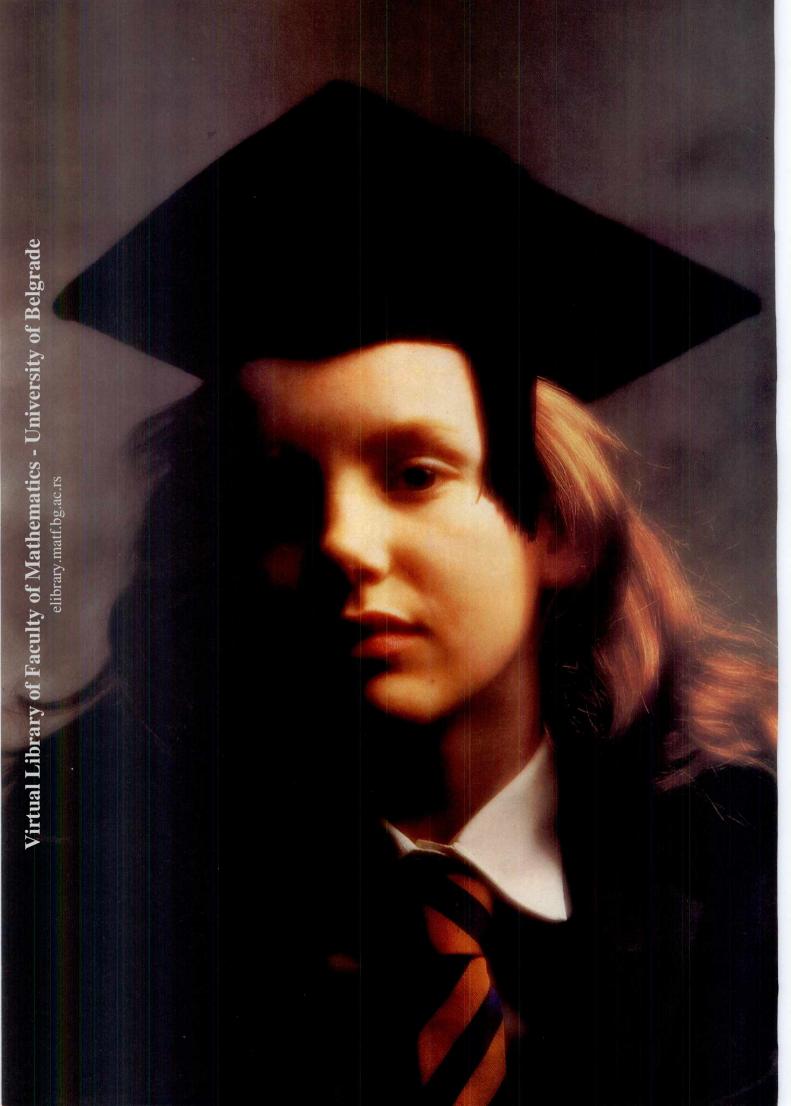

Wait for the Miracle to happen.

It won't be long.

And it'll be well worth the wait.

HNOLOGY LTD.

If you want to know which computer to buy, ask your expert.

You knew it would happen some day. Some day, your child would become smarter than you.

What you didn't expect was that it would happen so soon. To you, computers are a mystery from the future.

But to your children, they are a real source of excitement.
And they're happening now.

THE FIRST FAMILY COMPUTER.

So what will this young expert say when you ask which computer to buy? First, make sure that you have sufficient power for your needs. That your computer is easy to learn, and easy to use. And that it has a challenging, entertaining and expanding range of software.

The Dragon 32 is the first computer specifically designed for the family. And as such, we feel that it meets even our young expert's stringent criteria.

The Dragon offers a truly massive 32K RAM memory - harnessed by the advanced 6809E microprocessor. This is quite simply more than you're ever likely to need - but it does mean that your computer's capabilities can respond to

your increasing ability as you learn your way around.

And how quickly you'll learn. The Dragon's easy-to-follow instruction manual helps. But what will really get you going is the fact that you'll be enjoying every minute.

And when it comes to ease of use, the Dragon's professional-quality keyboard makes your computer as familiar as a typewriter.

SOFTWARE TO MATCH.

Dragon software offers a great range of games-but that's not all. You'll find educational programs. Programs to help you plan your money. Even programs which teach you how to program.

And whether you're playing or working, you'll be

learning more and more about this increasingly important new technology.

The Dragon 32 costs just £175.00*. For that, you get all the features that your child could ask for - which means just one thing. It's a very grown-up computer indeed.

SPECIFICATIONS

6809E MICROPROCESSOR.
The most powerful eight bit processor available

32K RAM (as standard). At least twice the memory of most similarly priced machines.

EXTENDED MICROSOFT
COLOR BASIC (as standard).
Featuring: ADVANCED GRAPHICS
(set, line, circle, paint, print, draw,
rotate and print using). ADVANCED
SOUND 5 octaves, 255 tones.

LARGE RANGE

Xitan are main U.K. distributors for Digital Research Inc., MicroPro Inc., Microsoft, Ashton-Tate, Sorcim and IUS, and suppliers of a large range of software from other leading software houses such as Byrom and Ecosoft. Most software can be supplied in a comprehensive range of formats.

Looking After our Dealers - so You Know Where to Look

OKIrules, OK!

Quality, reliability and unbeatable price performance are the hallmarks of the Oki Microline family. The only truly complete range of low-cost printers.

Exciting recent additions to the family are the Microline 92 and Microline 93 (80 and 132 column respectively). These feature NLQ print. 160 cps print speed and high resolution graphics

With these additions the family covers the broadest possible range of capabilities. From the small but very efficient 80-column, 80 cps. Microline 80, to the top-of-the-range.

Microline 84. This sophisticated and professional machine offers speeds up to 200 cps. NLQ print and pin-addressable graphics.

All Microlines are made to Oki's exacting quality specifications, and all are backed by X-Data's high-level technical support capability.

Whatever your print needs, there will be an Oki printer to fit your bill And at astonishingly low cost

DEMYSTIFY DISC COPYING

The disc copy card with all the great features of SNAPSHOT, plus:

WIDER COMPATIBILITY: Works with virtually any 16K card

EASIER TO USE: Just press the trigger on the attached extension cable. Never open your Apple's cover. Simple 1-2-3 copy procedure. Copies most programs in 30 seconds.

PEELINGS 11 magazine (Feb 1983) compares SNAPSHOT with Wild Card and Crack-Shot:

"Overall, with one of the supported RAM cards, SNAPSHOT is the best buy.

"The copy procedure is perhaps the easiest and clearest of the three cards."

SNAPSHOT will copy any memory-resident program that runs on the 48K Apple. SNAPSHOT uses your 16K RAM card* to interrupt a running program and dump the entire contents of 48K and registers to an unprotected backup disc. SNAPSHOT backs up programs that baffle nibble copiers like Locksmith without any complex parameter changes or trial-and-error hassle. And SNAPSHOT is still more effective, less expensive and easier to use than its imitators.

- ★ You have full, normal use of other hardware and software
- * Ideal for debugging or analyzing programs.
- ★ Freeze-frame your game! Print the graphics on your printer and resume play

- Shooting down space invaders and the phone rings? Interrupt your game until later, or tomorrow. Save your high scores!
- Repeatedly interrupt and resume running programs.
- Faster and easier to use than nibble copiers or other copy cards.
- Full monitor capabilities to examine, modify, trace, single-step or disassemble any interrupted program.
- Suspend work with one program while you use another (for instance, interrupt word-processing a letter to look up an address in a database, then resume the letter exactly where you left off).
- Move protected programs to hard disc or 8" disk; copy several programs onto the same disk.
- List "unlistable" Basic programs; make custom modifications.
 Backups run without SNAPSHOT present; most run without 16K card.

And there's more! Write or ring for complete technical information.

PRICE: £95.00* from your local dealer or Dark Star Systems

Terms: Payment with order. Add 19% VAT. P&P included. VISA/BARCLAYCARD and Am Ex accepted. Dealer enquiries invited. Foreign: No VAT. Add £2 postage to Europe, £7.00 elsewhere.

* Apple II or II+ or Franklin, one drive and Language Card/16K required. Works with most popular cards, including Apple, Microsoft, Computer Stop, Merton, Ramex, Digitek, MPC, RH Electronics, Orange, Franklin, etc. Other brands: specify when ordering. Graphics interface card and printer. Version Apple II or II+ or card and printer. Version for Apple II E ENQUIRE NOW!

78 Robin Hood Way, Greenford, Middlesex. UB6 7QNW Telephone: 01-900 0104

ftware's not the menu,

How would you like to sell your programs to thousands of genuine, enthusiastic and committed users?

If you're a professional supplier, how would you like to get rid of all those merchandising headaches on your general and games software?

And how would you like to do all this from just one cassette?

Micronet 800 makes all this possible.

When this huge database for microcomputers was faunched just a few months ago, it attracted thousands of enquiries from educational, business and home users. Users who could see the huge new vistas opened up by Inking them with Micronet 800...an 'Aladdin's Cave' of nundreds of programs which can be downloaded to machines like the BBC Micro, ZX Spectrum, ZX81, Apple II, Tandy TRS80, and PET...hundreds of thousands of pages of news, reviews, product data and prices from the computer world and from Prestel... and an electronic mailbox for exchanging messages and ideas with other users right across the country.

All this for around a modest 15p a day. Subscribers are linked by telephone through a modem...making it the fastest and most direct means of selling your software

downline to genuine and serious buyers.

Right now, Micronet 800 is looking for further general and games software to add to its enormous library. This is an opportunity which authors and suppliers, professionals and hobbyists, simply can't afford to ignore.

Get on-line today and find out what you stand to gain

from Micronet 800.

Phone Robin Wilkinson, Software Manager on Peterborough (0733) 237111, or send your disk or cassette together with the coupon to Micronet 800 to the address below.*

I Facuity of Mathematics - Universit

How to mak work like a

First, neatly cut out the "370" label.

Now, when nobody's looking, nonchalantly tape it to your terminal, just under the "IBM," as if it really belonged there.

Then wait for your chance and quickly slip a dBASE II™ disk into your main drive.

That's it.
Your IBM Personal
Computer is now ready to
run a relational database
system, the kind that IBM has

on their mainframes. And you're ready with more data handling power than you would have dreamt possible before dBASE II.

You'll wonder how you managed without it.

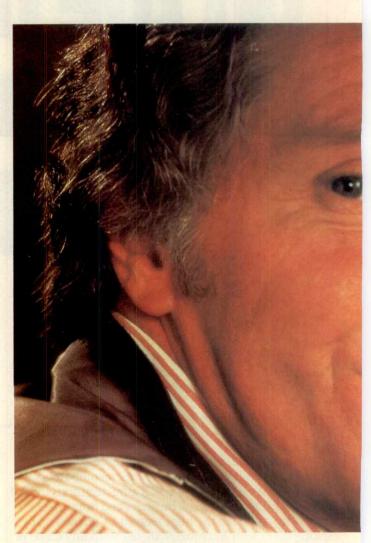

You'll find that dBASE II, because it's a relational database management system (DBMS), starts where file handling programs leave off. dBASE II handles multiple databases and simplifies everything from accounting to department staffing to monitoring rainfall on the Upper Volta.

With a word or two, you CREATE databases, APPEND new data instantly, UPDATE, MODIFY, and REPLACE fields, records and entire databases. Organize months worth of data in minutes with the built-in REPORT. Do subfield and multi-field searches, then DISPLAY some or all of the data for any condition you want to apply.

And you've just begun to tap the power of dBASE II.

Easy to look at, easy to use.

Input screens and output forms couldn't be easier—just "paint" your format on the screen

and what you see is what you'll get.

You can do automatic calculations on fields, records and databases, accurate to 10 digits.

And you can use dBASE II interactively for answers right now. Or save your instructions, then repeat everything with two words: DO Manhours, DO Project X, DO whatever has to be done.

Use dBASE II to help make your choice:

Instead of just poring over a manual, you can check out dBASE II by running it on your own system free for 30 days.

e your micro mainframe.

Visit your dealer and run through a handson demonstration. Then buy a package and use it on your IBM PC, Sirius or CP/M computer. If you don't like it, return it and you'll get your money back, no questions asked.

But if you do that, you'll have to remove that label. Because nothing short of a mainframe works like dBASE II.

LONDON'S WEST END - NATIONWIDE OVERNITE SERVICE MORE PRODUCT RANGES PROBABLY THE WIDEST SELECTION OF NETWORKS...MICROS... AND PRINTERS ON DISPLAY

WE OFFER ONE OF THE BEST 'SYSTEM DEALS' IN THE UK (Save £1500.00+) **** THE NEW DBMS III.7 (series III of the world's first 'task-robot-programs') ****

**** FEATURES ****

All files multi-user accessible 1400 character record sizes mathematical scratchpad record relational indexes translateable to any language User-defineable reporting field protection/classification either-or.same as.greater.smaller sorts 'alpha or numeric' any window

12 online file architectures 240 fields using cross-referencing cross-record calculations 'Jump-to' any record in 12 files User-defineable files/field words/sizes 32000 records per filename 20 main/200 sub fields per record field and record related formulae 'Jump-to' any of 32000 records per file

random/binary/key/multiple field search 'if-then' questioning file protection/password entry range match.not match.integer match sort speed 500 records per 20 seconds endless 'either-or' matching formulate/recall on selection criteria 13 interrogation question types short filing output/audit trails Word-star & Mbasic compatible

DBMS III.7 new switch mode facility enables you to cross up to 12 different files (32000 records per file) pre-selecting any of up to 20 fields per record/file for display/print output (240 fields) in all. One massive enquiry can pass through 384,000 records.

You might have two files whose records are directly related to each other, so that the first file (say containing names and addresses) refers to the second file (say financial and other information relating to the same record numbers if the first file) directly. Then you can simply choose that in file 1 you are interested in just the name and telephone numbers, whereas in file two, you are interested in the income, trading period and number of branches, information. Your enquiry can then pass through both files highlighting that information only. Actually there doesn't need to be a strict correlation between the same record numbers in different files, and you can also on just one JUMP command go to any record in any of the 32000 records in any of the twelve files and carry on cross-referencing from there onwards.

DBMS'S MACROS WORK FROM THE MOMENT YOU INSERT THE 'TASK DISK' IN THE COMPUTER

DBMS S MACHOS WORK FHOM THE MOMENT YOU INSERT THE TASK DISK. IN THE COMPUTER
Simply design your file, give its fields your words, setup your report mask, and then enter your records. Switch to 'automatic drive' and formulate any task you wish the program to fulfill, the task is stored as a macro. Take a copy of the program on another 'task disk' and from then on, the task disk will function without a single keystroke. Think of a number of such 'task disks' such as "stock-re-order reports"; "stock-valuation reports"; "analysis"; "patient history analysis"; "research-analysis"; "budgetting"; "plus more?"

Not only does this program surpass most of its kind that you might buy elsewhere, but if you buy the hardware from us, then you get it - FREE...

DBMSII (WITHOUT MACROS) AND DBMS III ARE FULLY IMPLEMENTED UNDER CPM-86 (tm) AND MS-DOS (tm) ie: <SIRIUS/VICTOR/IBM> DBMSII IS 395.00 (or 250.00 by mail order ex. training). DBMSIII is 575.00 (or 295.00 by mail order ex. training).

MICRO-COMPUTERS

SOFTWARE

Contains the highest state of the art software available today
FORMS/TEST/CALC/DBMS – ALL IN ONE PROGRAM THE "KEY" @ 675.00

When you budget for a complete system of software you eventually end up with a host of packages like: Sales, Purchases, Nominal, Data, Text, Calc, Mailshot, Invoice, Order, Workflow, Personnel, and so on. The list is endless and the outlay several thousands of pounds

Features: Design a form as wide as a window of 250 characters, long as needed. Cursor movements are 'left, right, up, down, delete left, delete right, tab right-left-up-down'. Paint your form as you like directly on the screen. (Order/Invoice/Budget/Indent etc).

Text: Write a letter as you see it on the screen, edit it then simply enter ^P to print.

Calc: Set into the form, your data fields, "££££££" and specific file-related activities, formulae and validation checks. Enter values and see the spreadsheet

Database: Search files for data to be inserted to fields specified. All the features of DBMS III, explained elsewhere in our ad.

Here's an example of an invoice you might design for your stationery...You could design your own spreadsheet, order form, statement, wage docket, or any other kind of form that is required to fit your existing

INVOICE .O. EEEEEEEEEEEEE

To E-1-EECCCCCCCCCC E-2-EEEEEEEEEEEEEEEEE

QUARIUS

AQUARIUS: The brand new Aquarius Personal Computer is part of Mattel Electronics latest developments in Electronics latest developments in advanced technology and offers full home computing facilities, as well as extensive game play, using a very wide range of plug in cartridges. Since Aquarius is a Mattel Electronics product, it benefits by the company's

product, it benefits by the company's wide experience of producing high technology equipment, as well as their game programming expertise which is evident from the advanced games which have been produced for the Intellivision. Aquarius costs £79 and comes with microsoft basic built in. It is so simple to use that you'll be writing your first programs within minutes of taking the machine out of its box. You can even your programs are appeared to be a considered to the programs of the programs of the programs of the programs of the programs of the programs of the programs of the programs of the programs of the programs of the programs of the programs of the programs of the programs of the programs of the programs of the program of th record the programs on your own cassette recorder at home, so you can use them again at a later date. Most available domestic tape recorders are compatible with the Aquarius.

A POWERFUL MACHINE: For all its simplicity, it is also very sophisticated. It has a Z80A processor and 8K of built in ROM as well as 4K of RAM, which is user expandable to 52K. It has a display of 40 x 24 characters, and a graphic resolution of 320 x 192 with a total character set of 256 (including the complete ASCII set with upper and lower case letters, numbers and additional graphic symbols). The keyboard has 49 full stroke moving keys, unlike some of the cheaper machines which have membrane keyboards. The size of the machine (excluding any of the additional peripherals), is 13"x6"x2".

PERIPHERALS: It is very easy to increase the capabilities of your Aquarius as all the peripherals plug straight into one another. You can add a Printer, a Modem, a Data Recorder, Mini Expander and other items. All of the peripherals are very easy to install and what is more, they're easy to use. But the best news of all is, they're easy to afford.

CPM OPERATING CAPABILITY: The Aquarius is capable of being expanded to 52K RAM and later in 1983 a disk drive will be available for it, with the commercial CPM business operating system. This will allow you access to one of the largest software libraries in the world, with literally hundreds of programs available for you to use.

CARTRIDGES: Various sophisticated programs will be launched on plug in cartridges such as a Visicalc type spreadsheet and a word processor. In addition there will be dozens of games and utilities and alternative languages such as Logo, which combined with the built in microsoft basic gives an

unbeatable combination of high quality programming ability.

MATTEL AQUARIUS - £68.70 + VAT = £79

ATARI 400/800: With the Atari Personal Computers, you can play the ultimate in T.V. games, teach yourself new subjects or skills, balance budgets, and even write your own computer programs in Basic.

SPECIFICATIONS: Both the Atari 400 and 800 can display in up to 16 colours, each with 16 intensities. They have four independent sound synthesizers for music tunes/game sounds, giving four octaves with variable volume and tone control on your T.V.'s speaker. The display graphics

are of amazing quality, having a detailed resolution of 320 x 192, comprising 24 lines of 40 characters. Atari personal computers have a standard 10K ROM operating system. In addition the standard Atari 400 (£149) comes with 16K of RAM, and the expanded version with 48K (£198). The Atari 800 (£299) comes with 48K as standard. Both the 400 and 800 are now supplied with a FREE £40 Basic Programming Kit, which includes the Basic Programming Cartridge, as well as a 120 page Basic Reference Manual and the 184 page Self Teaching Manual by Bill Carris called 'Inside Atari Basic', so you can begin programming straight away, without buying any 'extras'. Even a mains plug is supplied!

OVER 500 PROGRAMS AVAILABLE: The Atari computers are supported by well over 500 programs available for your use, a larger selection than you will find on any other television game or home computer! The wide selection puts Atari way ahead of the competition. Just fill in the coupon and we will be pleased to send you a full price list which gives details of our range of software available for entertainment, home education, programming and home office use. We think you'll agree when we say it's quite impressive.

100 FREE PROGRAMS FROM SILICA SHOP: If you buy your Atari Home Computer from Silica Shop, you will recieve a FREE presentation pack of 6 cassettes, containing 100 programs including games, utilities and demonstrations. A 16 page booklet giving full details of all of these programs is available on request. If you have already purchased your computer elsewhere you can buy the set of 6 cassettes for £30. What's more, Silica Shop offer a two year guarantee on all computers as well as a FREE joystick. This adds up to a great offer that we believe can't be beaten or matched by any of our competitors.

ATARI 400 16K - £129.57+VAT=£149 ATARI 400 48K - £172.17+VAT=£198 ATARI 800 48K - £260.00+VAT=£299

THE SYSTEM: The CBS Colecovision offers new standards in video game play. The excellent graphics are well implemented with arcade titles such implemented with arcade titles such as Zaxxon, Lady Bug, Gorf, Wizard of Wor, Carnival, Mouse Trap and the lovable Smurfs. The console comes supplied with a three screen arcade quality version of DONKEY KONG. Parker and other companies have also announced ranges of cartridges for Colecovision, to further enhance the wide range of quality titles available for this new television games machine.

THE CONSOLE: The CBS Colecovision video games system has advanced technology which produces superlative graphics resolution and excellent sound effects. The styling of the console and hand controllers has been carefully researched; the console is designed to complement modern hi-tech equipment, and has clear features for easy operation. The hand controllers allow fingertip control via the 8 direction joystick, and feature 2 independent fire buttons. The push button keyboard is used for game selection and for game control with some cartridges. The hand controllers are detachable and are connected to six feet of telephone coil cable, storing neatly away in the console when not in use.

ATARI EXPANSION MODULE: The Atari converter module allows Atari VCS software cartridges to be played on the Colecovision console, allowing owners the freedom to purchase from the extensive range of Atari compatible cartridges. It also means that existing Atari owners can buy the CBS Colecovision games system without discarding their software library. Silica Shop offer part exchange facilities if you wish to upgrade.

TURBO EXPANSION MODULE: The Turbo Driver Expansion Module allows you to actually drive the vehicle that appears on your T.V. screen. The module consists of a steering wheel, dashboard and accelerator pedal. One hand controller is mounted on the dashboard to provide a gear change unit. The module comes complete with a Turbo Driver cartridge, the first of several cartridges to make use of the module, which provides all the action of sitting in the driving seat. This facility is unique to CBS Colecovision.

HOME COMPUTER EXPANSION MODULE: The Home Computer Module scheduled

for late 1983, allows conversion of the games unit into a sophisticated Home Computer. This flexibility of design is an important feature of the CBS Colecovision System. COLECOVISION - £127.82 + VAT = £147

is a totally unique Home THE SYSTEM: Vectrex is a totally unique Home Arcade System, which has been exclusively designed and engineered to duplicate real arcade game play. Complete with its own monitor display, Vectrex won't cause any arguments over the use of the family's television because it has its own built in screen.

THE SCREEN: Vectrex does not use ordinary display techniques, instead it uses vector scanning to control the images on the screen. With this scanning method, the gun only updates the area of the screen that has changed, whereas a normal T.V. re-transmits the ENTIRE screen 50 times a minute. It is this that gives Vectrex its speed, 50 times a minute. It is this that gives Vectrex its speed, and means that very little computer power is required for screen control, and the results provide very fast responding and clear images. These 'Vector Graphics' are used in several arcade games such as Asteroids and Battlezone, to give you incredibly high resolution and quality. Vectrex brings all of this from the arcade right into your living room. The Vectrex screen is capable of displaying 80 columns by 40 lines, which is significant to the extensive developments planned for the system.

EXCITING SOUNDS AND ELECTRONICS: Vectrex has an advanced microprocessor with more speed and power and exciting effects than many home video games systems.

REAL ARCADE CONTROLS: Vectrex has a unique control panel, similar to those used in many real arcade games, with 4 concave action buttons and a full 360° self centering joystick. This control panel has a 4 foot detachable cord for maximum player freedom.

REAL ARCADE GRAPHICS: Vectrex has its own 9 inch vertical screen and unlike a conventional T.V. screen, uses advanced display technology to achieve brilliant, high resolution imagery and superb game play never before possible. The Vectrex display provides special effects too, such as 3-D rotation and zooming in and out, which a regular T.V. cannot match. Using a black and white monitor, each Vectrex game comes supplied with its own coloured plastic screen overlay to add to the excitement of game play. The range of Vectrex cartridges (£21.95 each), gives a good selection of arcade games such as Berzerk, Scramble, Rip-Off and Bomber Attack. Vectrex comes complete with a fast paced 'Minestorm' game built into memory.

VECTREX: Vectrex has an advanced state-of-the-art microprocessor with more speed than other T.V. games. VECTREX - £129.57 + VAT = £149.00

WHO ARE SILICA SHOP?

Silica Shop are one of the leading specialist suppliers of Video Games & Personal Computers. We consider that our service, to those who already own or to those who are interested in any products in our range, cannot be matched by any other supplier. Just look at what we have to offer:

ATARI VCS (2600) - THE NO 1 BRAND LEADER IN THE U.K.

ATARI: The Atari Video Computer System known as the Atari VCS or the 2600 has now become the T.V. game brand leader. In the U.K. there are over 700,000 owners of the VCS with access to a range of over 200 different plug in cartridges, each having a multitude of different variations and difficulty levels. Every system comes complete with the main console, two individual joystick controllers, a pair of paddle controllers, aerial splitter, mains adaptor and a 27 game Combat cartridge. It gives you bright crisp graphics, realistic sound effects and even specially designed circuits for the protection of your Television Set.

SECONDHAND GAMES: We currently have several secondhand Atari VCS units in stock which we are selling for only £49 (inc VAT). This price includes the Console, with Combat

Cartridge and all the accessories, as well as a 12 month guarantee. We also have stocks of several secondhand cartridges many at half price (all with 12 months guarantee). We will normally buy back secondhand units and cartridges at one third of our standard price.

EXTENSIVE CARTRIDGE RANGE: The Atari VCS is so popular that in addition to Atari's own cartridges, there are over 150 compatible cartridges, produced by at least a dozen different third party manufacturers. Silica Shop has one of the largest cartridge selections available in the U.K. Our range of over 200 titles (printed either side of this column), includes items in stock now, as well as many of the new releases for later in 1983.

ATARI CLUB: Silica Shop has over 20,000 Atari VCS club members registered on our computer. As a specialist company we are able to obtain advance information about new developments and send detailed catalogues to all of our club members, enabling them to evaluate new products before they buy. This is a totally FREE service, to receive your copies complete the coupon below.

SERVICE CENTRE: Atari International (UK) Inc has recently appointed Silica Shop as an authorised Atari Service Centre. This means that we can now service your Atari VCS or 400/800 (under guarantee if applicable), whether or not you purchased it from us.

VCS COMPUTER KEYBOARD: A keyboard will soon be launched to convert the VCS into a fully programmable home computer. For further details, join our club by completing the coupon below. We will then let you know when further information is available.

STARPATH SUPERCHARGER: The supercharger plugs into the cartridge socket of your VCS and expands its RAM almost 50 fold, from 128 to 6,272 bytes. This increased memory adds vivid high resolution graphics capabilities and significantly lengthens the game playing time. Supercharger has a range of multi-load games (at £19.45 each), these offer the facility to play a game in several distinct parts (great for adventures), the next section being loaded when you have completed ATARI VCS CONSOLE- With Combat Cart & Accessories £68.70+VAT = £79.00

We stock a wide range of accessories for the Atari VCS and 400/800 personal computers. The same accessories can be used on the Commodore VIC range of computers. The Wicc can also be used with the Texas Instruments computers on purchasing a special aptor. To give you an idea of the range available, just take a look at the following list:

LE STICK: A mercury filled joystick specially made for one handed operation, with thumb fire button.

QUICK - SHOT: This joystick features a contoured handle grip, thumb trigger and optional base fire button. It is supplied with 4 sure foot suction grips.

STARFIGHTER: Neat and compact with a small direction stick. Metal interior for added strength.

VIDEO COMMAND: With a tapered handle, this joystick is for one handed use. It has directional control which is similar to a jet fighter joystick.

CO RED BALL: An arcade type joystick with a red ball handle, it features 2 fire button locations, one at the base and one on the ck. It comes supplied with 4 grip pads for easier table top use

MICO STRAIGHT - STICK: The main feature of this oystick is its arcade style, bat handle grip. It also has 2 fire buttons. Four grip pads included for table top use.

wico TRACKBALL: A true arcade style trackball for use with your Atari or Commodore VIC. This product is designed to give arcade control in your living room.

**EXTENSION LEAD: A 12' extension for Atari and **tari compatible joysticks for greater player freedom.

MATTEL INTELLIVISION: attel games unit is a most versatile T.V. game which offers 3-D graphics quality for only £98. Each cartridge comes with 2 overlays which fit over the unique hand controller giving easy directions for game play. Using the handset's control disc, objects

can be moved accurately in 16 directions giving a realistic simulation of lifelike movement. VOICE SYNTHESIS: The Intellivoice unit, price £49, is used with special cartridges where high quality synthesised male and female voices feature as part of the game play.

NEW MATTEL CARTRIDGE RELEASES: Why not complete the coupon below and join the Silica Mattel Owners Club and receive our FREE news bulletins and 16 page catalogues detailing new Mattel releases. There will soon be over ninety cartridges available for the Mattel, and a small selection from these is listed below:

MATTEL: Artic Squares, Burger Time, Buzz Bombers, Chess, Cloudy Mountain, Loco Motion, Mission X, Mystic Castle, Sharp Shot, Solar Sailor, Space Shuttle, Vectron, Winter Olympics. <u>ACTIVISION</u>: Happy Trails, Fitfall, Stampost, C.B.; Blue Print, Cannial, Donkey Kong, Gorf, Mousterap, Smurf, Solar Fox, Turbo, Venture, Wizard of Wor, Zaxxon. [MAGIC: Bezzer, Oracula, Ice Trek, Nova Blast, Safecracker, Swords & Serpents, Tropical Trouble, White Water. <u>PRARKER</u>; James Bond 007, Lord of the Rings, Popere, Q.Bert, Spideman, Star Vers, Super Cohr, Turakham.

COMPUTER KEYBOARD: In July/August 1983, Mattel will be launching their new ESS, 49-key computer keyboard attachment called 'Lucky' which is fully programmable and has microsoft basic built in. It will transform your Master Component into a home computer. The adaptor also accepts a 6 note polyphonic music synthesiser and full size 49-key piano keyboard that will make

MATTEL CONSOLE £85.22 + VAT = £98.00

DEO GAME

a fast moving market like video games, it is difficult to keep up to date with all the developments that take place. With new programmes and accessories being introduced at a fast rate by several different manufacturers, it is impossible to get all the information or require from one manufacturer alone. It is for this reason, that we have set up owners clubs for the more popular video games and home computers, to keep you fully up to date with what is going on with your particular machine. As far as we know, Silica Shop are the only company to offer such clubs, but that is not surprising since we are the specialists. We currently have FREE clubs for the Atari VCS, Atari 400/800 home computers, and Mattel Intellivision. Soon we will have clubs for Colecovision, Aquarius and Vectrex. So if you own one of these machines, fill in the coupon opposite, and we will enrol you FREE OF CHARGE in the club relevant to your computer or video game

SGS SOFTWARE PRODUCTS LIMITED 66 MARYLEBONE LANE, LONDON WI

Buy 'n Try - the sensible way to shop for software. Simply buy any item from our software range. Try it out at home. If it's not exactly what you expected, then we'll buy it back for a full 80% of the price you paid against another purchase of equivalent or greater catalogue value any time within 1 month of purchase.

Which means you can keep right up to date with the latest software and games releases without making costly mistakes.

Example: Buy a game for £10. If it's not as good as you thought, then we'll buy it back for £8 against your choice of another game worth £10 or more. Just send us the difference. There's just one simple rule we can only agree to buy back software that's in working order.

Look at our super selection and complete the order form to take advantage of the hottest software deal ever, or telephone your order to Software Centre on 01-487-5974, quoting your Access/Barclaycard number (24-hour telephone service).

Buy an off-the-peg personal computer for your business and the

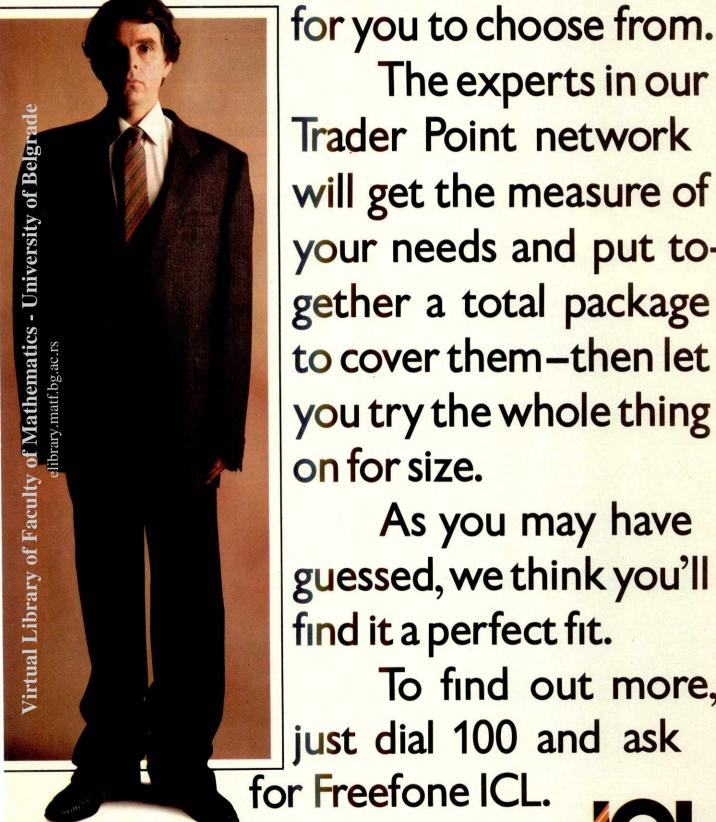

results should hardly

surprise you.

Because too many manufacturers turn out a standard model, and that's your lot.

The ICL Personal Computer, however, is far more personalised. Not too big for your immediate needs, yet designed never to cramp your style - it grows with you.

Storage and disc facilities can be increased up to 16 and 30 times, running up to four VDUs. And there's a vast catalogue of software

The experts in our Trader Point network will get the measure of your needs and put together a total package to cover them-then let you try the whole thing on for size.

As you may have guessed, we think you'll find it a perfect fit.

To find out more, just dial 100 and ask for Freefone ICL.

We should be talking to each other.

elibrary.matf.bg.ac.rs

95 inc VAT and 40p postage and packing

ORICMON

A complete machine code monitor including mnemonic assembler/disassembler block move and verify, trace and slow-motion run and full cassette handling, plus manual £15.00 inc VAT and 90p postage and packing 16k or 48k

3D LINK 4

A set of new exciting and challenging games Hangman, Moonlander, Substrike, Roadrace and 3D Noughts and Crosses. ARL

HOUSE OF DEATH

If you were baffled by Zodiac you will be terrified by House of Death. Can you discover the secret of the haunted house and escape with your life' £9.99 inc VAT and 40p postage and packing 18k

ORIC BASE

This is a database system used for the maintenance of personal and small business information. It is supplied on cassette with a comprehensive manual. A sophisticated query language is used to manipulate data and allow reports to be printed, data to be sorted or moved about and running totals to be kept. A Macro command facility allows the creation of application specific command strings which can be used easily by non-technical personnel. Requires a 48k machine. Price: £14 50 including VAT and 90p postage and packing.

ZODIAC

A traditional adventure game in which the player has to find the 12 cunningly hidden signs of the Zodiac which lead him to greater treasures. The player manipulates objects through simple sentences which the program can understand and can ask for his score at any time. A save game feature is also included. Requires a 48k machine. Price: £9.99 included VAT and 40p postage and packing.

ORIC-CHESS

Using high resolution graphics to display the Using high resolution graphics to display the chess board this package will play a challenging game of chess with five levels of skill. The computer looks ahead for its own moves plus its opponent's. The skill level dictates how far the computer looks ahead although at the expense of more time. All chess rules including Castling and En Passant are obeyed. Requires a 48k machine. Price: £9.99 including VAT and 40p postage

This is a cassette-based implementation of FIG-FORTH, the language distributed by the Forth Interest Group in the United States. It has been extended to utilise the graphics and sound capabilities of the Oric. It is supplied with an editor and a full Forth assembler. 96-page manual is included in the package A demonstration music program is also supplied. Requires a 48k machine. Price: £15.00 including VAT and 90p postage.

ORIC OWNER MAGAZINE, £10

.Why should you subscribe to ORIC OWNER? Your Oric 1 is one of the most powerful low-cost computers on the market today Oric Owner is the only magazine totally dedicated to the Oric and its supporting hardware and software.

From issue to issue *Oric Owner* is able to bring you in-depth information on the Oric, advance news on the latest add-ons, superb programs to try and 'behind the scenes' interviews with the engineers who designed it. If you wish to keep ahead of the latest developments and news on the Oric then Oric Owner is essential. At only £10 for a year's subscription of 6 issues (£15 for overseas readers) can you afford to be without Oric Owner? SUBSCRIBE TODAY!

Calling all Software Writers.

If you can write top quality games, business or utility software we want to hear from you. Haven't got an Oric? Convince us of your capability and we will supply one!

3-D Budgetting out of this world

Spread sheet programs have been available for a number of years. The knowledge and experience gained through the use of these led to a demand for a tool that is easier to use, easier to understand and more powerful than contemporaries. The result is Calc Result — a powerful yet low cost '3D' spread sheet for the Commodore 8000 and 64.

* Three dimensional format

- * Up to 32 pages with consolidation
- * Horizontal and vertical page split
- * View part of up to 4 pages at one time
- * Powerful editing facilities
- * Compare budgets with "What if . . . " facility
- * "if . . . then . . . else" choice of calculation
- * Graphics output on screen and printer
- * Miserly use of memory
- * 'Help' functions on screen
- * Multi user capabilities and hard disk support
- * Ability to load VisiCalc[™] files

Machine capability

CalcResult is currently available on Commodore Business machines as follows:

8032 and 8096 computers — including the SK series on 8250 or 8050 disk units. It can also be used in multi-user situations and with Commodore 9060 and 9090 hard disks.

Commodore 64 — a single disk version for the 1541 disk unit, and serial printer.

Price

For 8000 series £149 (plus VAT)

you can take it anywhere

but so what!

The EPSON HX-20 is the first complete briefcase - portable computer. It has a full - size typewriter keyboard, four line screen, printer, microcassette drive, rechargeable batteries all in a lightweight package the size of a phonebook.

SO WHAT can it do for you?

Its Word Processing enables you to note down ideas anywhere: on a plane, in a meeting, in a hotel room. Letters or reports can be typed in silently whilst on the move and then printed out back at base.

Its Database System means you can store customer details, pricing information, or stock data and retrieve or print out selectively at the customers office - here or anywhere in

Its ECALC Spreadsheet gives you financial modelling so you can prepare business or personal budgets at work, at home or on the train between the two.

Its Communications link you with your larger computer, with various printers, with the telex network or with the resources of the Onestop Business Centres.

Diary, adding machine, payroll, salesman's package, games.....the list is growing daily.

SO WHERE can you get your HX-20? From Integra and Onestop - the HX-20 specialists. Here you receive excellent back up and support from a growing network of business centres. These centres provide you with the greater computer storage and printing power - but you only pay for what you use.

the EPSON HX-20 from

Call Integra to discuss your requirements on:-01-935 0685 (West End) or (04862) 22450 (Woking).

Or drop into your nearest Onestop Business Centre at:-Victoria: 11 Gillingham Street, London SW1. 01-828 5425 Croydon: 9 Essex House, College Road. 01-688 7481

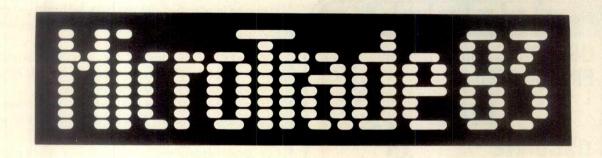

Reading: 11 Duke Street. (0734) 591888

MOST OF THE PEOPLE READING THIS AD SHOULDN'T BE READING THIS AD...

Unless, that is, you're over 18 and a bona fide computer retailer or distributor or thinking of becoming one. If so, you're invited to **MICROTRADE 83** at London's Barbican Centre from 6-8 July.

MICROTRADE 83 is unique. Not only because there will be many new products and services on display, from Act, Burroughs, Logica, Portico and Sharp, amongst others, but because it's the only microcomputer show for the trade alone.

Which means everyone will be speaking the same language – with exhibitors looking for retailers and distributors and visitors talking availability, margins and support.

SPONSORED BY MICROSCOPE BARBICAN CENTRE, LONDON. 6-8 JULY.

Make a stake in the future. Phone Timothy Collins on 01-486 1951 for your free invitation, or send your letterhead or business card marked 'MICROTRADE' to Montbuild Ltd 11 Manchester Square London W1M 5AB (01-486 1951)

MICROTRADE 83 is a trade-only show. No-one under 18 admitted

For special MICROTRADE travel and accommodation arrangements contact:

Pharoah Hughes Associates – 01-995 8995.

Portable problem

It is something of a mystery how the same micro can be sold by its manufacturer and a separate distributor under different names.

It can cause severe hostility between the two companies involved and the motivation behind it must surely contain an element of greed — that is to say, the manufacturer notices 'it's selling at lot of them. Why don't we sell it too and cash in — after all we built the thing in the first place.'

Actually the root of this little story is rather less simple, but the end result is just as unnecessary.

Readers may have heard of the Ajile portable. They may also have heard of the Hyperion. The two are one and the same. The Ajile is sold by Anderson Jacobson, which also makes acoustic couplers and other communications devices, and the Hyperion is sold by its manufacturer Bytec, through a subsidiary, Gulfstream Technology.

The original manufacturer, Canadian company Dynalogic, had concluded an OEM agreement with Anderson Jacobson before it sold out to Bytec — unknown to the latter. Upon hearing that Gulfstream would also be selling the machine in the UK,

Anderson Jacobson's PR firm Patria Design sent out a press release under the heading 'Ajile versus Hyperion' which was allegedly authorised by AJ's marketing manager Mike Parrish.

The communication claimed that AJ was 'undaunted' by competition from Gulfstream because AJ, unlike Gulfstream, 'can guarantee a reliable countrywide field service'. Talk about goading an ox...

The release, coupled with a flyer to AJ customers offering a 20 per cent discount on the Ajile, incurred the wrath of Gulfstream and led to Patria Design losing the AJ account. A release from Patria insists that the PR outfit was instructed to issue the offending missive and that the subsequent sacking was 'the easy way out' for AJ's managing director Brian Warrington. AJ now denies authorising the release although, according to Patria Design, the 'unauthorised' release was discussed between Mike Parrish and a journalist. Patria's Jennifer Morbey believes she has been turned into a scapegoat to cool AJ's blushes.

So the sum total of this little storm in a teacup is that, because someone jumped the gun, a PR firm lost an account and two companies look very silly indeed. We are now told that the two companies do not want to tread on each other's toes and wish to co-operate. But how can they, selling the same computer under rival trademarks?

Snippets

A symposium of eminent American psychologists, says The Times, 24 May, has recently held a forum entitled 'Donkey Kong, Pacman and the meaning of life' . . . A press release about a software company, Pegasus Software, which arrived in the ivory tower early in May, was titled 'Pegasus — a synonym for success'. Could this mean that the word Pegasus will soon be integrated into modern language as such? Soon we may well be referring to 'a really pegasusful young executive' or the computer that was 'never much of a pegasus' ... What with Miss World assisting in promotions in her charming way, Epson is going a long way towards buttering up the press as we all know that revered profession deserves. Now it's doing the same thing for its distributors with a free, all-expenses-paid golfing weekend in Cornwall. We're told that this trip 'reflects Epson's move towards a fully committed distributor force... Hippie types, gurus and trendies who read the Whole Earth Catalog will be edified to know that there is also a Whole Earth Software Catalog. This is published by Point Foundation and licensed by Doubleday & Co of New York. Knowing the content of the Whole Earth Catalog makes the mind boggle with respect to its silicon stablemate - could make interesting reading... Remem-

ber the Statutory Sick Pay packages? If not, in May Chip Chat it was mentioned that wastebins were stuffed full of press releases from large numbers of software houses all having had the same idea SSP Software. A recent report in Computing, the well known computer trade journal, explains that some of these packages may be causing companies to lose vast amounts of money in sickness benefit which is not due. This is apparently caused by a package's inability to allocate sick pay to specific days of the year. Some of the systems are also incapable of holding enough details on an employee. At least twelve weeks of details, says Mike Copleston of IMS, a consultancy firm, should be kept at any one time. One wonders if IMS is selling its own SSP package?

STOP PRESS...

In order to keep delivering our monthly package of news, views and useful info about the micro world *PCW* is in need of a *FEATURES EDITOR*.

We are looking for somebody with a keen grasp of the industry, a lively interest in micros, writing skills and no mean wit.

The FEATURES EDITOR will play a key role in our small team and the job will include commissioning and writing articles.

Salary in accordance with experience.

If this sounds like you please write with CV to The Editor, Jane Bird, PCW, VNU Business Publications, 62 Oxford St, London W1A 2HG.

BLUDNERS

Let's try again with Oric Bug Eater. In lines 1085 and 1105, the pound sign (£) should be entered as a hash (#)—SHIFTed 3. This applies to any program listing unless the pound sign is inside quotation marks. Line 8066 has closing quotes missing after the full

stop. Line 11076 should read as follows: 11076 L=0: N\$='''': K\$=KEY\$: I\$=''''. If you have a 16k Oric, insert the following line: 3 HIMEM 13311 and then edit line 1020 to read: 1020 READ DA: POKE 13312+D+8*ASC (''!''), DA

If, on the other hand, you have a 48k machine, leave line 1020 alone and don't even think about adding line 3: simply delete line 2 instead. Ok so far? Good. The following modifications apply to both 16 and 48k machines: 1111:PAPER(F-1) AND 7: INK(F+1) AND 7, 1170 X=20: Y=24: T=0: H=1:

PLOT X,Y,"\$", 10090 K\$=KEY\$: WAIT 100.

Moving onto the MZ-80K Pascal program, we told you that the program was written under the Hi-Soft Pascal 3, but the title of the program disappeared somewhere along the line. We were in fact referring to MZ-80K 'Double Trouble'.

There were two omissions in 'Spectrum Blaster'; one in the listing and one in the description. The line 35 LET SS=450 is missing and the 'A' in lines 160 and 212 are graphics characters.

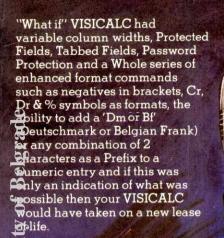

Yet another correction to a correction! Last month, we

gave two lines missing from PET Billy. These lines were in fact slightly wrong. In both lines, there should be five, not three, spaces after the cursor-control at the beginning of the line, and you should also add five cursor-lefts to the end of each line.

Finally, two lines were inadvertently omitted from the Lisp database (June *PCW*, page 150). Fig 9 should commence (DEF MY (YOUR 2)

(DEF MY (YOUR 2 ((YOUR @ MFBS / FAMILY) (HOW WELL DO YOU AND YOUR = /FAMILY GET ON ?))

For those with no time to waste.

If we then told you that your model could be as large as 255K and it was possible to 'Save' it to disk in only 45 secs (136K in 20 Secs) you might think we were talking about the IMPOSSIBLE!

The Super Expander 80.2 is a REALITY, manufactured by Vergecourt for use with a standard VISICALC on the Apple ii Plus or Apple 11e and requires at least one Ramex 128 Expansion Board to be fitted to the System.

All other expansions cost MORE for LESS so contact your dealer without delay.
